and the North Dakota State Water Commission

1965

This is one of a series of county reports published cooperatively by the North Dakota Geological Survey and the North Dakota State Water Conservation Commission. The reports are in three parts; Part I describes the geology, Part II presents ground water basic data, and Part III describes the ground water resources. Parts I and III will be published later and will be distributed as soon as possible.

Geology and Ground Water Resources of Divide County, North Dakota
Part II, Ground Water Basic Data
by
C. A. Armstrong

INTRODUCTION

Purpose and scope

The geology and ground-water resources of Divide County, North Dakota (fig. 1) has been investigated cooperatively by the U. S. Geological Survey, the North Dakota State Water Commission, and the North Dakota Geological Survey. The results of the investigation are to be published in three parts. Part I, an interpretive report describing the geology, Part II, ground-water basic data, and Part III, an interpretive report describing the ground-water resources. Part II makes available data collected during the investigation and functions as a reference to Parts I and III. The reports will be published as separate volumes of the Bulletin series of the North Dakota Geological Survey and the county ground-water study series of the North Dakota State Water Commission.

The data in this report are useful for predicting subsurface conditions in Divide County. The depth and thickness of aquifers, water levels, and quality of water may be estimated for a given site by examining the tables and maps in this report. Extrapolations based on these data should be conservative because of the irregular distribution of materials within the glacial drift.

Much of the data in this report was collected during field studies made between July 1962 and December 1964. Other data were obtained from: (1) an unpublished Works Progress Administration report, which shows 1934 and 1938 water levels, (2) records collected during 1945 and 1951 for the Missouri River basin development investigation, (3) North Dakota State Water Commission drillers' logs compiled in 1959, and (4) a few miscellaneous data collected by the U. S. Geological Survey between 1951 and 1960. This accumulation of data is presented in five tables: (1) data from a comprehensive inventory of water wells, test holes, and springs, (2) drillers' and composite logs of wells and test holes, (3) water levels in observation wells, (4) partial chemical analyses of water from a report by LaRocque and others (1963), and (5) chemical analyses of water. Additional logs, water levels, and chemical analyses of ground water are published in an open file report by LaRocque and others (1963) and in U. S. Geological Survey Water Supply Papers 598 and 1428.

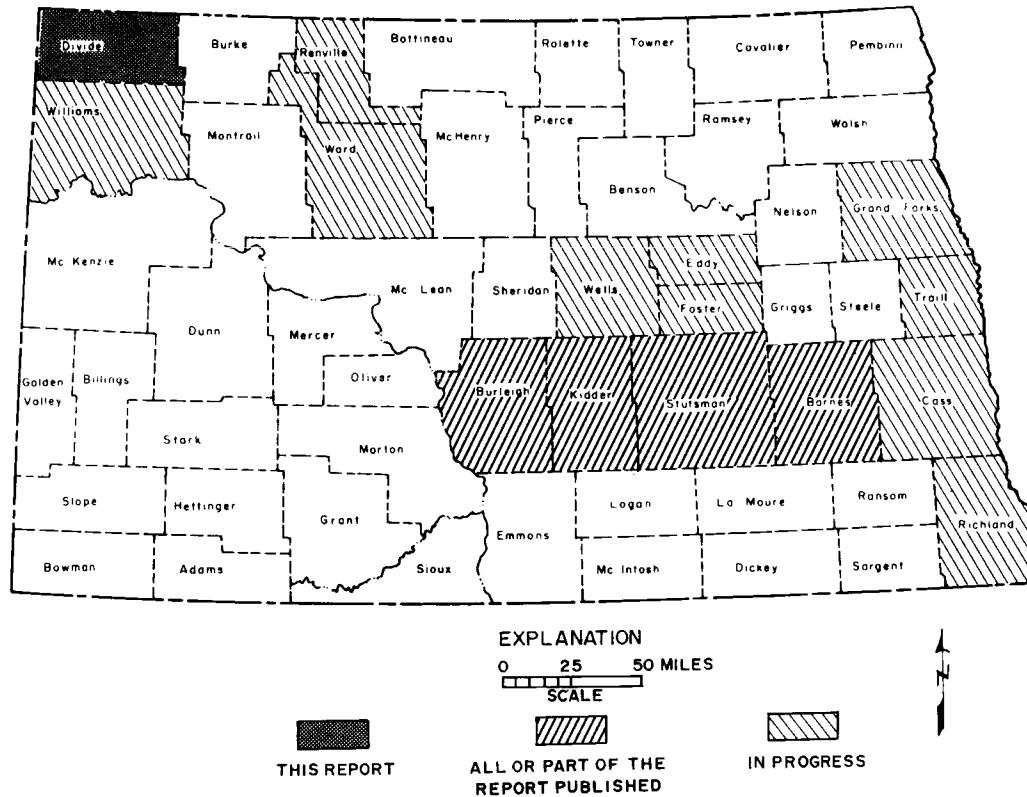

FIGURE I—MAP OF NORTH DAKOTA SHOWING LOCATION OF COUNTY GROUND-WATER STUDIES

Well-Numbering System

The wells, test holes and springs in the tables are numbered according to a system based on their location in the public land classification of the United States Bureau of Land Management. It is illustrated in figure 2. The first numeral denotes the township north of a base line, the second numeral denotes the range west of the fifth principal meridian and the third numeral denotes the section in which the well is located. The letters a, b, c, and d designate respectively, the northeast, the northwest, southwest, and southeast quarter sections, quarter-quarter section, and quarter-quarter-quarter sections (10-acre tract). For example, well 160-95-15daa is in the NE₁NE₁SE₁, sec. 15 T. 160 N., R. 95 W. Consecutive terminal numerals are added if more than one well is recorded within a 10 acre tract. The location of each well, spring and test hole listed in the tables is shown on figures 3 and 4 (in pocket).

Acknowledgments

The author is especially grateful to Schnell Inc., Marinus Jensen, Oscar Weber and other drillers who supplied logs and information for this report. Thanks are also due to the County Commissioners, township assessors, and the people of Divide County for their cooperation in the collection of these data. Sample analysis logs were compiled principally by R. W. Schmid and L. L. Froelich of the North Dakota State Water Commission.

Explanation of Tables

Table 1 shows many wells with the abbreviations lpc in the remarks column. This indicates that the aquifer will yield less than the capacity of the pump. Therefore, the well can be pumped dry with the pump shown in the lift and power column. Most of the farm wells in the county are equipped with pumps that have capacities of less than 10 gpm (gallons per minute); cylinder pumps usually are limited to 2 to 5 gpm.

Test holes 2243 and 2249 and 3000 to 3090 were drilled as part of this investigation. The unnumbered U. S. Geological Survey test holes were drilled as part of the Missouri River basin investigation (MB). These logs are from LaRocque and others (1963). Test holes 1523 to 1532 were drilled by the North Dakota State Water Commission (ND) as part of a special State investigation. Other test holes were drilled by their owners. Owners numbers are used in table 1 but only test holes drilled during this investigation are numbered on figure 4.

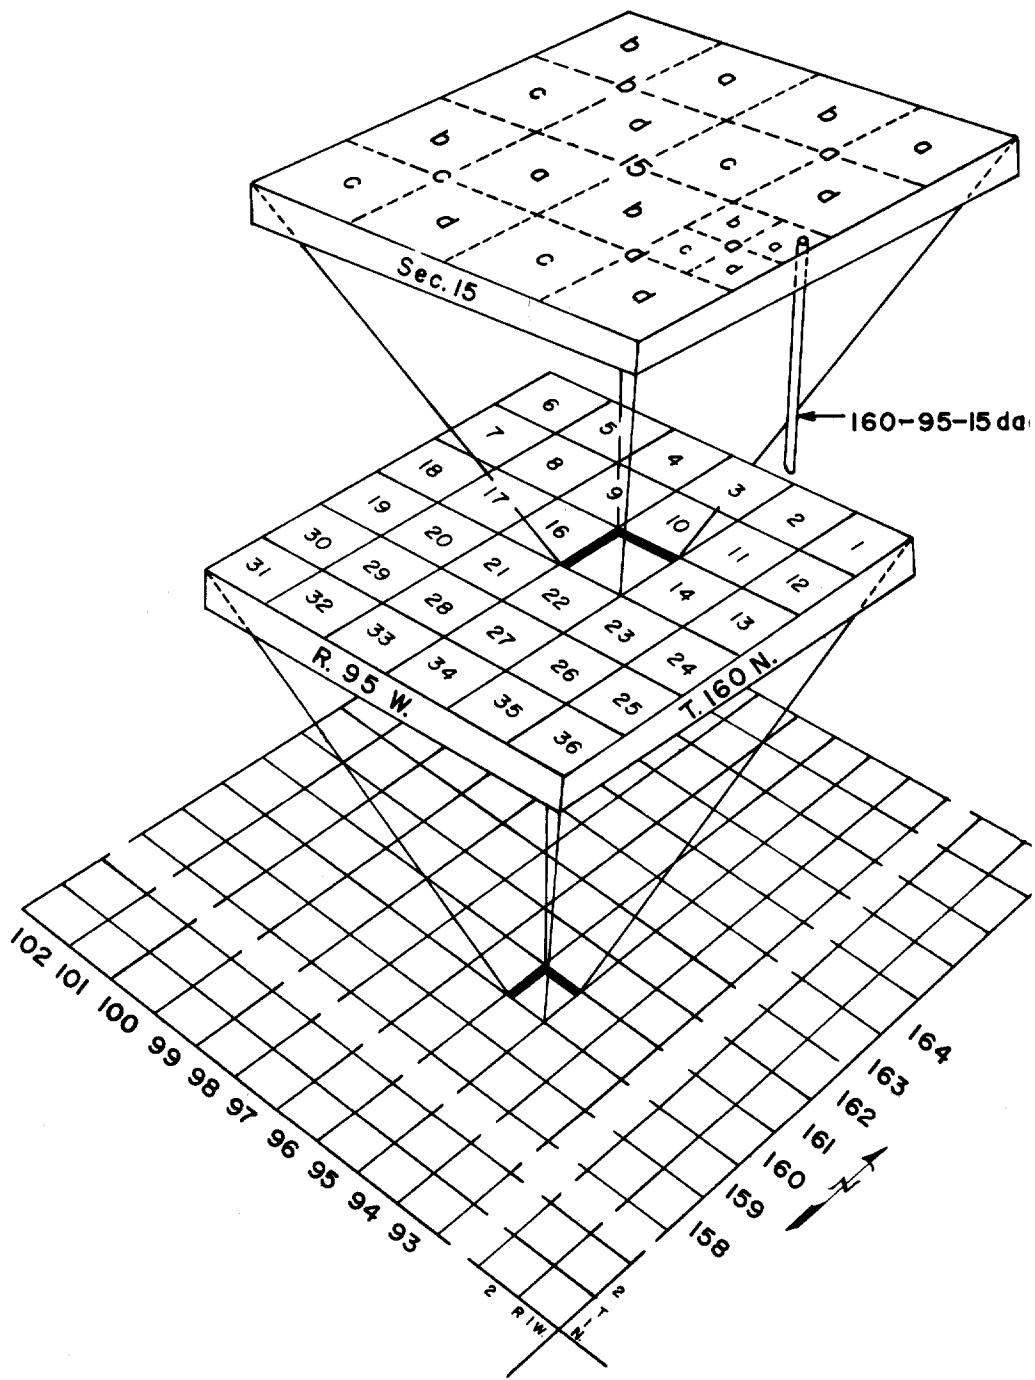

FIGURE 2--SYSTEM OF NUMBERING SPRINGS, WELLS, AND TEST HOLES.

The numbered test-hole logs are a composite from the drillers log, sample-analysis log, and electric log (when available). Logs of unnumbered test holes and wells were furnished by the driller or drilling company shown in the heading of the log, or, were obtained from the report by LaRocque and others (1963). The terminology used is that of the individual driller with the exception that the order has been changed to present the principal lithology first. The drilling intervals shown in these logs were rounded to the nearest half foot where a lesser interval was listed.

Sample-description logs for test holes 3000 to 3039, 3075 to 3090, and 2243 to 2249 were prepared at the drilling site of each test hole. Visual examination, while the samples were still wet and fresh, was made by the use of a binocular microscope. Color descriptions were determined by comparing the sample with the color charts of Goldman (1928). If the cuttings reacted (effervesced) with diluted acid the material was described as calcareous. Grain-size determinations used in all logs refer to the Wentworth (1922) size scale. Sorting is used as an indication of size distribution on either side of an average. Cohesion is used to indicate the capacity of the material to stick together. Since most clays and silts are cohesive to some degree the term was not used in the descriptions unless the material was unusually cohesive.

The term "till" indicates an unsorted, unstratified, cohesive, agglomeration of rock particles ranging from clay to boulders. In Divide County, all the till encountered was calcareous. Generally clay is the dominant particle size. If a particle size other than clay is dominant, that particle size is used as a modifying term. Consequently, terms such as clayey, silty, sandy, or gravelly are textural terms used to indicate that the material described contains an appreciable, but not a dominant amount of the modifying material.

Observation wells were developed in selected test holes. These normally consisted of 1½-inch plastic pipe slotted in the lower 10 or 20 feet. They were pumped for a few hours and a sample of water was collected for chemical analysis (table 5). Monthly water-level measurements (table 3) have been made in most of the wells.

Names of the bedrock formations, such as Tongue River and Cannonball Formation, are based on usage of the North Dakota Geological Survey. The Tongue River and Cannonball are considered members of the Fort Union Formation by the U. S. Geological Survey.

Quality-of-Water Data

Several factors determine the concentration and character of mineral constituents in ground water. The most important are the source of the water, the mineral composition of the rocks through which the water has passed, and the length of time the water has been in contact with the rock. Precipitation as rain dissolves some gases from the air. That part of the precipitation that percolates to the water table, having dissolved carbon dioxide from the air as well as from the organic matter in the soil, reacts with rock particles, dissolving them and forming new compounds. The dissolved-solids content of water usually increases with depth, because the deeper water generally has been in contact with rock minerals longer than has water at shallow depths. The principal constituents in ground water are calcium, magnesium, sodium, potassium, bicarbonate, sulfate, and chloride. Other constituents include silica, iron, nitrate, fluoride, and boron. Most analyses are given in parts per million (ppm)--a unit that expresses concentration of chemical constituents by weight.

Specific conductance is a convenient, rapid determination used to estimate the amount of dissolved solids in water. An approximate value for dissolved solids concentration can be obtained by multiplying the specific conductance by 0.65.

The suitability of a water for public supply and domestic use can be judged by standards that have been established by the U. S. Public Health Service (1962, p. 7-8) for drinking water used on interstate carriers. Some of these standards are as follows:

Iron (Fe) should not exceed 0.3 ppm.
Chloride should not exceed 250 ppm.
Sulfate should not exceed 250 ppm.
Fluoride should not exceed 1.7 ppm.
Dissolved solids should not exceed 500 ppm.

These standards were established to protect the health of interstate travelers but generally are also used in evaluating the suitability of public water supplies in the United States. Although many people continually drink water containing substantially higher concentrations than the suggested limits, persons unaccustomed to such water may suffer ill effects until they become adjusted to the change.

Some livestock have been known to survive on water containing as much as 10,000 ppm of dissolved solids (Smith and others, 1942, p. 15). However, water containing much less dissolved solids is desirable for maximum growth and reproduction.

The maximum concentration for nitrate has not been established, but Maxcy (1950, p. 271) states that water having a nitrate content in excess of 45 ppm should be regarded as unsafe for infant feeding because it may cause methemoglobinemia ("blue baby" disease). Also, the presence of nitrate may indicate pollution.

Moderate quantities of fluoride are not known to be detrimental to crops, animals, or adult humans. However, it is generally recognized that a small amount of fluoride in drinking water consumed by children during the time their permanent teeth are being formed reduces the occurrence of dental caries (tooth decay) and that an excess may cause dental fluorosis (mottled enamel).

The tolerances in chemical quality of water for industrial use differ widely for different industries and different processes. In general, water that meets U. S. Public Health Service standards for drinking water is suitable for most industrial uses.

Hardness of water is an important consideration in domestic, municipal, and industrial supplies. It is expressed in parts per million as calcium carbonate. Water having a hardness of 60 ppm usually is rated as soft, whereas water having a hardness of 61 to 120 ppm is considered moderately hard and water having a hardness of 121 to 180 ppm is considered hard. Water having a hardness of more than 180 ppm is regarded as very hard. Hardness is caused almost entirely by calcium and magnesium. As hardness increases, soap consumption for laundering increases, boilers, pipes, and coolers (evaporation pads) become encrusted more rapidly. Silica also forms hard scale in boilers.

Oxidation of dissolved iron in water forms a precipitate that stains laundered clothes and plumbing fixtures. Water containing more than 0.3 ppm of iron is likely to cause objectionable staining. Water that contains iron is especially objectionable in some manufacturing processes.

The usefulness of a water supply for irrigation cannot be predicted solely on the chemical quality of the water. Other factors such as soil texture, infiltration rate, drainage, climate, and salt tolerance of the crop must be considered. According to the U. S. Salinity Laboratory Staff (1954, p. 69-82) the characteristics of an irrigation water that appear to be most important in determining its suitability are: (1) Total concentration of soluble salts; (2) relative proportion of sodium to other cations; (3) concentration of boron or other elements that may be toxic; and, (4) under some conditions the bicarbonate concentration as related to the concentration of calcium plus magnesium.

The U. S. Salinity Laboratory Staff (1954, p. 70) stated that nearly all irrigation water used successfully for a considerable time has a conductivity less than 2,250 micromhos per centimeter at 25° C. Water of higher conductivity is used occasionally but has not been satisfactory except in unusual situations.

The relative proportion of sodium to other cations can be expressed either by percent sodium or SAR (sodium-adsorption-ratio). Both of these figures have been included in table 5.

Generally, the higher the SAR value, the greater the sodium hazard; however, the conductivity or dissolved solids concentration must also be considered in classifying the water according to sodium hazard so that although two waters may have the same SAR value, the water with the highest conductivity is given a higher sodium hazard classification. Samples indicate that water with a SAR value of 8 or less in Divide County would be classified as having a medium or low sodium hazard and water with an SAR value of 14 or more would be classified as having a very high sodium hazard.

TABLE 1.--Records of wells, springs, and test holes

Owner: USGS, United States Geological Survey; NDSWC, North Dakota State Water Commission.

Depth of well: Measured depths are given in feet, tenths, and (or) hundredths; reported depths are in feet below land surface.

Type of well: B, bored, Dr, drilled, Du, dug; Dv, driven.

Depth to water: Measured depths are given in feet, tenths, and (or) hundredths; reported depths in feet.

Use of water or well: D, domestic; Ind, industrial; Irr, irrigation; N, not used; O, observation of water level; Ps, public supply; S, stock; T, test hole.

Aquifer: Cl, clay; Gv, gravel; Lg, lignite; Sd, sand; Sdy, sandy; Ss, sandstone.

Lift and Power: B, bucket; C, cylinder; Cen, centrifugal; J, Jet; P, piston, Sub, submersible; Tu, turbine; E, electric; G, gas; H, hand; W, wind.

Remarks: C, chemical analysis is shown in table 4 or 5; L, log described in table 2; Wh, water reported to have alkaline taste; Wh, water reported to be hard; Ws, water reported to be soft; Wp, water reported to be unfit for human consumption; Lpc, well yields less than pump capacity; Pl 30, pumping level in feet below land surface; T, temperature; Td 665, total depth drilled in feet; T₃, additional water levels in table 3; ls, land surface; MB, data from Missouri Basin Investigation (LaRocque and others, 1963).

TABLE 2.--Logs of wells and test holes

160-95-22aad
Test hole 3000

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
	Sand, clayey, very fine to very coarse, unsorted, very calcareous-----	6	6
	Gravel, medium sand to small pebbles, subangular; pebbles predominantly limestone and quartz-----	7	13
	Till, dark greenish-gray-----	12	25
	Clay, silty, greenish-gray, very calcareous-----	14	39
	Till, dark-greenish-gray-----	21	60
	Till, light-olive-brown, oxidized-----	30	90
	Till, light-olive-brown to dark-greenish-gray, partly oxidized-----	10	100
Tongue River Formation:			
	Sand, very fine, moderate dark-yellowish-orange, subrounded to well-rounded, oxidized-----	49	149
	Shale, light gray-----	5	154
	Lignite, black-----	4	158
	Clay-----	2	160

160-96-26bbb
Test hole 3001

Glacial drift:			
	Soil-----	2	2
	Sand, coarse, oxidized-----	15	17
	Silt, dark-yellowish-orange, oxidized, calcareous-----	3	20
	Silt, dark-greenish-gray-----	23	43
	Gravel and sand, fine sand to medium gravel, sub- rounded; abundant limestone, quartz and igneous pebbles-----	10	53
	Till, dark-greenish-gray-----	34	87
	Till, moderate-yellowish-brown, oxidized; contains some shale, limestone and a few lignite frag- ments-----	23	110
	Till, moderate-yellowish-brown and dark-gray-----	20	130
	Boulder-----	1	131
	Till, dark-gray and moderately-yellowish-brown-----	11	142
	Till, dark-gray; few boulders-----	51	193
	Sand, silty, greenish-gray, fine to very fine, calcareous-----	32	225
	Sandstone and gravel-----	2	227
Tongue River Formation:			
	Shale, silty, greenish-gray-----	13	240

160-97-5abb
Test hole 3036

Glacial drift:			
	Soil, black, loam-----	1	1
	Clay, yellowish-gray, thinly laminated, oxidized-----	2	3
	Till, silty, moderate-olive-brown, oxidized-----	12	15
	Till, silty, light-olive-gray, partly oxidized-----	17	32
	Till, silty, olive-gray-----	180	212
	Gravel, fine sand to large pebbles unsorted, sub- angular to subrounded-----	10	222
	Till, silty, olive-gray-----	27	249
	Gravel, fine sand to small pebbles unsorted-----	8	257
	Till, olive-gray-----	59	316
Tongue River Formation:			
	Clay, light-gray and light-greenish-gray, cal- careous; some lignite-----	14	330

160-97-13bbb
Test hole 3002

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil-----		2	2
Sand, very coarse-----		5	7
Sand, silty, very fine-----		13	20
Silt, dark-greenish-gray-----		25	45
Clay, shaley, dark-greenish-gray-----		6	51
Silt, dark-greenish-gray-----		7	58
Sand and gravel, fine sand to medium gravel, sub-rounded, poorly sorted-----		20	78
Till, dark-greenish-gray-----		27	105
Gravel-----		3	108
Till, dark-greenish-gray-----		7	115
Silt, sandy, dark-gray and olive-gray, calcareous, few fossil fragments, (dark-gray color due to organic matter)-----		7	122
Till, dark-yellowish-orange, oxidized; few limestone and shale grains-----		17	139
Tongue River Formation:			
Sand, silty, very fine, oxidized calcareous-----		7	146
Silt, dark-yellowish-orange, oxidized, (grading downward into) silt, lignitic, dark-greenish-gray to brownish-black-----		12	158
Limestone-----		2	160

160-97-16acb
Randolph Kettel

(Log furnished by Marinus Jensen)

Clay, sandy and rocks-----	6	6
Clay, brown-----	15	21
Sand-----	2	23
Clay, brown-----	11	34
Clay, blue-----	22	56
Sand, (dry)-----	3	59
Clay, sandy-----	28	87
Gravel-----	3	90
Clay, blue-----	60	150
Sand and gravel-----	20	170
Clay, blue-----	90	260
Missing-----	10	270

160-97-32aac
Albert Pieper

(Log furnished by Schnell Inc.)

Topsoil-----	1	1
Clay, yellow-----	13	14
Clay, gumbo, dark-----	13	27
Till, sandy, gravelly-----	12.5	39.5
Rock-----	.5	40
Clay, gravelly-----	48	88
Sand and gravel with boulders-----	17	105
Clay, layer-----	6	111
Sand, coarse with clay layers-----	7	118
Sand and clay-----	6	124
Gravelly-----	16	140

160-97-32cca
Frank Salveson

(Log furnished by Schnell Inc.)

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Sand and gravel-----	14	14	
Clay, blue-----	87	101	
Sand, fine-----	13	114	
Gravel, coarse with lignite-----	19	133	
Clay-----	7	140	

160-97-32daa
Observation well 3-862

Glacial drift:

Soil, silty, dark, organic-----	1	1
Clay, silty, white to olive gray, soft, smooth, sticky, leached-----	2	3
Clay, silty with a little sand, yellowish brown, fairly cohesive, plastic, soft, leached in places, some coal, oxidized (till)-----	10	13
Clay, silty to sandy, olive gray, cohesive, plastic, oxidized in spots near top-----	86	99
Sand, coarse and fine to medium gravel, grayish, subangular to subrounded-----	7	106
Gravel, fine to medium, and coarse sand, contains some coal-----	20	126
Clay, silty to sandy, olive gray, cohesive, plas- tic (till)-----	6	132

160-97-32dac
Observation well 2-862

Glacial drift:

Sand, fine with some medium rusty brown, well sorted, subrounded, oxidized-----	10	10
Clay, slightly silty, bluish gray, smooth, soft, sticky, plastic, some coal-----	30	40
Clay, silty to sandy, bluish olive gray, cohesive, some lignite (till)-----	71	111
Silt, olive-gray, smooth-----	12	123
Sand, coarse and fine gravel with some medium sand, fairly well sorted, subangular to round- ed; predominantly shale, limestone, igneous, and metamorphic rocks-----	20	143
Clay, silty to very sandy, olive gray; moderately cohesive, slightly plastic, slightly calcar- ous (till)-----	4	147

160-97-32dca
Frank Salveson

(Log furnished by Schnell Inc.)

Glacial drift:

Topsoil-----	1	1
Sand, dry-----	9	10
Till (gravelly and sandy clay)-----	115	125
Sand and gravel-----	28	153
Clay, gravelly, with thin sand layers-----	32	185

Tongue River Formation:

160-97-32ddb₁
Frank Salveson

(Log furnished by Schnell Inc.)

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Loam, sandy-----		3	3
Sand and gravel-----		12	15
Clay, yellow-----		9	24
Clay, silty, blue-----		20	44
Clay, gravelly-----		72	116
Silt, sandy-----		5	121
Sand and gravel-----		17	138
Clay with boulders-----		2	140

160-97-32ddb₂
Observation well 1-862

Glacial drift:

Sand, silty to fine, dark brown-----	3	3
Clay, silty with some sand, yellowish olive, slightly cohesive, soft, oxidized, slightly calcareous (till)-----	21	24
Silt, very clayey, olive gray, plastic, slightly calcareous-----	6	30
Clay, bluish gray, smooth, plastic, sticky, slightly calcareous-----	5	35
Clay, silty to sandy, olive gray, cohesive, slightly calcareous, (till), some lignite in the till-----	8	43
Silt, clayey with some very fine sand, olive gray, smooth soft, plastic, slightly calcareous-----	13	56
Clay, silty to sandy, olive gray, cohesive, lignite particles, slightly to moderately calcareous (till)-----	65	121
Gravel, fine to medium, angular to subrounded, some olive gray shale; pebbles composed of igneous and metamorphic rocks, limestone, dolomite, and lignite-----	15	136
Clay, silty to sandy, olive-gray, cohesive, tight (till)-----	6	142

160-97-32ddb₃
Frank Salveson

(Log furnished by Schnell Inc.)

Glacial drift:

Loam, sandy and topsoil-----	4	4
Sand and fine gravel-----	10	14
Clay, yellow-----	7	21
Clay, silty, blue-----	28	49
Clay, gravelly with boulders-----	65	114
Sand-----	4	118
Sand and gravel-----	22	140
Clay, gravelly-----	19	159
Boulders-----	3	162

Fort Union Formation:

Clay, sandy-----	6	168
------------------	---	-----

160-97-33bbd
Leonard Rosten

(Log furnished by Schnell Inc.)

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Loam, topsoil-----	1	1	
Loam, sandy-----	3	4	
Clay, yellow-----	3	7	
Clay, gravelly with boulders-----	80	87	
Sand and gravel with rocks-----	22	109	
Rock-----	.5	109.5	
Clay layer-----	2.5	112	
Coarse sand with thin clay layers-----	15	127	
Clay, sandy (gravelly)-----	31	158	
Fort Union Formation:	2	160	

160-97-36bcb
Test hole 3003

Glacial drift:			
Soil-----	2	2	
Clay, silt, and sand, light olive brown, unsorted-----	12	14	
Clay, silty, dark-greenish-gray, slightly calcareous; few selenite crystals-----	20	34	
Till, gravelly, dark-greenish-gray-----	44	78	
Gravel, fine and medium sand, surrounded to well rounded pebbles predominantly quartz and limestone, with some lignite-----	20	98	
Till, gravelly, dark-greenish-gray-----	23	121	
Gravel-----	2	123	
Till, gravelly, dark-greenish-gray-----	18	141	
Silt, dark-greenish-gray, very calcareous-----	2	143	
Gravel-----	3	146	
Till, dark-greenish-gray-----	4	150	
Gravel-----	1	151	
Till, dark-greenish-gray-----	16	167	
Gravel-----	1	168	
Till, dark-greenish-gray-----	76	244	
Sand, very fine to very coarse, and dark-greenish gray silt, abundant lignite particles, calcareous; apparently interbedded-----	29	273	
Sand, very fine, and silt, some clay; interbedded-----	15	288	
Gravel, granule, sandy, rounded; abundant brownish pebbles-----	6	294	
Tongue River Formation:			
Clay, sandy, bluish gray, hard-----	26	320	

160-99-3bbb
Test hole 3016

Glacial drift:			
Fill-----	7	7	
Silt, sandy, dark-yellowish-brown to moderate-yellowish-brown, calcareous, oxidized-----	3	10	
Till, moderate-yellowish-brown, oxidized, abundant shale pebbles-----	7	17	
Till, dark-yellowish-brown, partly oxidized, abundant shale pebbles-----	13	30	
Silt, dark-greenish-gray, very calcareous, some fine sand-----	10	40	
Till, dark-greenish-gray, abundant shale pebbles-----	32	72	
Silt, sandy, olive to bluish-gray, slightly calcareous; mica flakes-----	3	75	

160-99-3bbb--Continued
Test hole 3016

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
Lignite-----	1	76	
Sandstone, bluish-gray, a few lignitic areas-----	16	92	
(From 72 to 92 feet appears to be a block of Tongue River sediments)-----			
Till, olive-gray to black, some lignitic particles-----	5	97	
Sand, fine to coarse, subrounded-----	55	152	
Till, olive-gray to dark-gray-----	45	197	
Sand (driller and E. log) no sample-----	5	202	
Silt, olive-gray, calcareous, slightly cohesive; contains some very fine sand and clay lenses, (no samples below 220 feet)-----	48	250	
Sand, very coarse, and gravel, granular, sub-angular; minor constituents lignite and pyrite-----	7	257	
Silt, olive-gray, calcareous, contains very fine sand-----	11	268	
Sand, very coarse, and gravel, granular, predominantly limestone, shale and lignite-----	9	277	
Rock, and clay, olive-gray (bouldery till?)-----	31	308	
Gravel, coarse sand to boulders, subangular-----	64	372	
Lignite-----	4	376	
Gravel, coarse sand to boulders, subangular-----	21	397	
Till (?) dark-greenish-gray (very poor samples)-----	11	408	
Gravel (very poor samples)-----	10	418	
Clay, sandy, brownish-black and olive-gray, very calcareous, lignitic (poor samples)-----	31	449	
Gravel, coarse sand to boulders, abundant dark brownish chips and a few "scoria fragments"-----	47	496	
Till, olive-gray; some pieces appear to be bed-rock (probably Tongue River sediments included in the till)-----	55	551	
Gravel, (can't distinguish new cutting)-----	5	556	
Silt, brownish-black and olive-gray, some fine sand, calcareous-----	4	560	
Tongue River Formation:			
Lignite-----	10	570	
Silt and sandy silt, light to medium light-gray, very slightly calcareous, some mica flakes and lignite-----	20	590	

160-99-8ccc
Test hole 1524-ND

Glacial drift:			
Soil, black-----	1	1	
Till, brownish-yellow to dark-yellowish-orange, oxidized-----	10	11	
Sand, fine to coarse-----	5	16	
Sand, fine to medium-----	26	42	
Sand, fine to medium, contains lignite fragments and shale pebbles-----	11	53	
Till, gray-----	26	79	
Clay, sandy, gray, contains lignite fragments-----	9	88	
Gravel, clayey, fine sand to coarse pebbles, unsorted-----	18	106	
Till, gray-----	20	126	

160-99-29bbb
Test hole 1523-ND

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil, brown		2	2
Till, brownish-yellow to dark-yellowish-orange, mottled, oxidized		31	33
Till, gray		42	75
Gravel, fine sand to medium pebbles		8	83
Till, gray		15	98
Gravel, or several small rocks (drilling action)-		5	103
Clay, light-gray		86	189
Till, gray		205	394
Clay, sandy, gray to light brown		21	415
Clay, carbonaceous, lignitic, contains some coarse sand grains		5	420

160-101-3aaa
Test hole 3030

<u>Fill</u>		3	3
Glacial drift:			
Sand, fine; and some dusky-yellow, oxidized silt-		7	10
Gravel, sandy, fine to coarse; predominantly com- posed of shale limestone, lignite and quartz--		20	30
Clay, silty, dusky-yellow, very calcareous, co- hesive, oxidized		13	43
Till, silty to sandy, dusky-yellow to moderate- olive-brown, partly oxidized		17	60
Till, silty to sandy, light-olive-gray		62	122
Tongue River Formation:			
Sand, very fine, and light-olive-gray, clayey silt, very calcareous, moderately to tightly consolidated		27	149
Sand, very fine and light-olive-gray, calcareous; clayey, silt; with thin interbedded sandstone lenses		7	156
Shale, light-gray		6	162
Silt, clayey, light-gray, very calcareous		8	170

160-101-11baa
Frank Eberle

(Log furnished by Marinus Jensen)

Glacial drift:			
Clay, brown		30	30
Sand, yellow		8	38
Shale, soft		18	56
Sand, fine		35	91

160-102-3bab
Test hole 3028

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil		2	2
Till, dark-yellowish-orange to yellowish-brown, oxidized		26	28
Till, silty, dark-greenish-gray		14	42
Till, olive-gray		62	104
Gravel, coarse sand to large pebbles, subrounded		4	108
Till, olive-gray		28	136
Till, olive-gray and dark-yellowish-orange; partly oxidized		18	154
Gravel, coarse sand to large pebbles, subrounded, contains some lignite and pyrite		2	156
Till, olive-gray		133	289
Gravel, medium sand to medium pebbles; minor con- stituents include ironstone concretions and a few wood fragments		3	292
Silt, greenish-gray, calcareous		18	310
Shale and silt, dark-greenish-gray		44	354
Sand, fine to very fine		9	363
Silt and sand, fine		8	371
Gravel, many brown pebbles		12	383
Tongue River Formation:			
Silt, sandy to clayey, greenish-gray to light greenish-gray, very calcareous, lignitic		17	400

160-102-6abb
Test hole 3027

Glacial drift:			
Soil		4	4
Till, moderate to dark-yellowish-brown, oxidized		16	20
Clay, silty, dark-yellowish-orange to moderate- yellowish-brown, calcareous, oxidized		7	27
Till, silty, dark-greenish-gray		75	102
Silt, dark-greenish-gray to olive-gray, calcareous, contains some sand		68	170
Till, dark-greenish-gray		30	200
Clay, silty, olive-gray to dark-greenish-gray, calcareous, and lignitic; some clay is shaley and some of which has black spots; appears to be from a swamp deposit		53	253
Silt, sandy, olive-gray		18	271
Clay, silty, olive-gray to dark-greenish-gray, some with black spots, calcareous, lignitic; is shaley		73	344
Gravel		1	345
Clay and silt, olive-gray to dark-greenish-gray		9	354
Gravel, brownish-pebbles and chips		4	358
Tongue River Formation:			
Clay, silty, light-gray to light-olive-gray, cal- careous; sandy silt in lower part		22	380
Lignite		5	385

Test hole 3005

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Gravel, very sandy, subrounded to well-rounded, oxidized-----	6	6	
Till, moderate-yellowish-brown, oxidized-----	8	14	
Till, moderate-olive-brown, partly oxidized-----	7	21	
Till, dark-greenish-gray, bottom few feet very sandy-----	12	33	
Gravel, sandy, medium sand to pebbles, subrounded, abundant limestone pebbles-----	11	44	
Silt and clay, olive-gray, calcareous-----	14	58	
Sand, fine to very fine, silt, olive-gray and clay olive-gray, probably interbedded-----	22	80	
Boulders, predominantly granite and sandstone-----	3	83	
Silt, olive-gray, calcareous-----	3	86	
Till, dark-greenish-gray, some sandy silt-----	14	100	
Sand, silty, fine to very fine spots-----	8	108	
Silt, olive-gray, with some black organic(?) spots-----	4	112	
Sand, fine to very fine, contains some gravel-----	8	120	
Clay (Till?) dark-greenish-gray, silty and sandy, very calcareous-----	25	145	
Till, dark-greenish-gray-----	40	185	
Silt, clayey, olive-gray to dark-greenish-gray, very calcareous; some black spots of clay-----	13	198	
Sand, gravelly, very fine to pebbles unsorted, dirty-----	1	199	
Silt, olive-gray to medium bluish-gray with black areas, calcareous-----	39	238	
Gravel, rounded, predominantly silicates, much brown staining and oxidation-----	22	260	
Tongue River Formation:			
Sand, very clayey, light-gray, very calcareous, slightly cohesive-----	40	300	

160-102-26aaa
Test hole 2249

Glacial drift:			
Soil, silty, black-----	1	1	
Till, silty to sandy, dusky yellow to moderate olive brown, partially oxidized-----	16	17	
Till, olive gray, contains a few thin gravel lenses-----	42	59	
Till, moderate olive brown-----	15	74	
Tongue River Formation:			
Clay, variegated light gray, light olive gray, light greenish gray, and olive gray, contains lignite streaks-----	62	136	

160-103-2bbb
Test hole 3026

Glacial drift:			
Till, medium to dark-yellowish-brown-----	35	35	
Till, dark-greenish-gray-----	27	62	
Gravel, fine sand to very large pebbles-----	10	72	
Clay, sandy, dark-greenish-gray-----	10	82	
Sand, fine sand to medium pebbles, subangular to rounded; abundant lignite and shale pebbles-----	40	122	
Till, dark-greenish-gray-----	12	134	

160-103-2bbb--Continued
Test hole 3026

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
Till, silty, dark-greenish-gray-----	6	140	
Silt, olive-gray and dark-greenish-gray with black areas, calcareous; contains clay and very fine sand-----	16	156	
Till, dark-greenish-gray-----	7	163	
Silt, clayey, olive-gray and dark-greenish-gray with black areas, calcareous-----	26	189	
Till, dark-olive-gray-----	44	233	
Silt, clayey, olive-gray and dark-greenish-gray with black areas, calcareous-----	19	252	
Silt, sandy, olive-gray, calcareous; contains lignite-----	121	373	
Gravel, granular, angular to well-rounded-----	8	381	
Silt, clayey, olive-gray and dark-greenish-gray, calcareous-----	9	390	
Gravel, granular, abundant brownish-stained and weathered pebbles-----	3	393	
Tongue River Formation:			
Sandstone, light-gray, very fine to fine, calcareous-----	12	405	

160-103-5aaa
Test hole 3025

Glacial drift:			
Soil, sandy-----	1	1	
Till, moderate to dark-yellowish-brown, oxidized-----	47	48	
Till, dusky-yellowish-brown, oxidized-----	2	50	
Till, olive-gray-----	3	53	
Till, dark-greenish-gray-----	21	74	
Sand, clayey and gravelly, very fine to medium pebbles; contains olive-gray silty clay lenses-----	16	90	
Sand, gravelly, very fine sand to medium pebbles-----	10	100	
Clay, silty, olive-gray; with lenses of fine silty sand-----	25	125	
Clay, and silty clay, dark-greenish-gray, hard; clays are calcareous-----	10	135	
Till, dark-greenish-gray-----	25	160	
Silt, greenish-gray, calcareous, some lignite fragments-----	12	172	
Clay, silty dark-greenish-gray, calcareous-----	5	177	
Gravel, medium sand to large pebbles; abundant well-rounded brownish, siliceous pebbles-----	6	183	
Tongue River Formation:			
Silt, clayey to sandy, varigated, dusky yellow, grayish-green, light-olive-gray, calcareous to noncalcareous; contains lignitic lenses-----	17	200	

160-103-16bbb
Test hole 3082

Glacial drift:			
Till, moderate-yellowish-brown grading downward into dark to dusky-yellowish-brown, oxidized-----	30	30	
Till, olive-gray-----	30	60	
Sand, medium, lignitic-----	36	96	
Gravel, medium sand to large pebbles, rounded, many pebbles are brown-----	4	100	
Silt, olive-gray, calcareous-----	26	126

Test hole 3082

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
Till, olive-gray-----	62	188	
Gravel, medium sand to medium pebbles, well-rounded; predominantly brownish pebbles-----	22	210	
Silt, olive-gray, calcareous, lignitic, cohesive-----	14	224	
Gravel, medium sand to medium pebbles, well-rounded, predominantly brownish pebbles-----	25	249	
Tongue River Formation:			
Lignite, greenish-gray sandy clay, brownish-black lignitic silt and greenish-gray, silty clay, interbedded-----	16	265	
Lignite, black-----	5	270	

160-103-20dcd
Test hole 3081

Glacial drift:			
Gravel, fine sand to large pebbles, unsorted, subrounded-----	8	8	
Till, moderate-yellowish-brown, oxidized-----	30	38	
Till, dusky-yellowish-brown, oxidized-----	12	50	
Sand, very fine to coarse, subangular to subrounded; contains clay lenses-----	34	84	
Silt, sandy, olive-gray, calcareous; gradational contacts, top and bottom-----	24	108	
Sand, silty, very fine to medium, subangular-----	24	132	
Sand, gravelly, very fine sand to small pebbles-----	4	136	
Till, light-olive-gray to olive-gray-----	16	152	
Gravel, coarse sand to large pebbles; abundant brownish and reddish, oxidized limestone granite and siliceous pebbles; limestone pebbles are surrounded other well rounded-----	10	162	
Tongue River Formation:			
Sand, silty, greenish-gray, calcareous, lignitic, bedded-----	13	175	
Lignite-----	10	185	

161-95-33ddd
Test hole 3039

Glacial drift:			
Clay, sandy and silty, yellowish-gray-----	5	5	
Till, light-olive-gray, oxidized-----	29	34	
Silt, dusky-yellow, calcareous, oxidized; contains lignite fragments-----	18	52	
Till, olive-gray-----	166	218	
Gravel, sandy, fine to coarse pebbles, moderately sorted, subangular to subrounded-----	17	235	
Till, silty and sandy, light-olive-gray, partly oxidized; appears to be mostly reworked Tongue River sediments-----	15	250	
Till, silty and sand, olive-gray; contains numerous boulders-----	26	276	
Till, silty and sandy, olive-gray-----	35	311	
Tongue River Formation:			
Clay, grayish-yellow, calcareous; contains some indurated limestone layers-----	9	320

Till, olive-gray, several boulders		19	77
Gravel, fine to coarse, poorly sorted, subangular to subrounded; limestone pebbles are highly oxidized		5	82
Till, olive-gray, cohesive		27	109
Gravel, fine to coarse, poorly sorted, subangular to subrounded		11	120
Tongue River Formation:			
Shale, medium-gray, moderately soft, and light gray, slightly fissile fine sand, probably interbedded		20	140

161-101-2cbc
Test hole 3090

Glacial drift:			
Till, dark-yellowish-brown, oxidized		20	20
Till, olive-gray		40	60
Silt, sandy, olive-gray, lignitic fragments, very calcareous, cohesive		50	110
Sand, very fine to fine		9	119
Silt, olive-gray, lignitic, very calcareous		11	130
Sand, very fine, and silt, olive-gray, lignitic, calcareous		37	167
Sand, no sample		11	178
Silt, olive-gray, lignitic, very calcareous		8	186
Sand, no sample		4	190
Silt, sandy, olive-gray, lignitic, very calcareous		34	224
Till, olive-gray		20	244
Silt and gravelly sand, very fine sand to small pebbles, apparently interbedded		14	258
Till, very silty, olive-gray and grayish-olive; with few thin sand lenses		57	315
Tongue River Formation:			
Silt, greenish-gray, greenish-gray clay, light-olive-brown sandy clay, and olive-gray, fine sand		15	330
Lignite, dusky-brown to black		15	345
Silt, sandy, olive-gray to light olive-gray, lignitic, very calcareous, cohesive		10	355

161-101-33cdd
Test hole 3029

Glacial drift:			
Soil		1	1
Clay, silty and sandy, light-gray, very calcareous		2	3
Clay, silty, light-olive-gray, partly oxidized, cohesive		17	20
Clay, silty, olive-gray		10	30
Till, olive-gray		20	50
Till, dusky-yellow to moderate olive-brown, oxidized		10	60

161-101-33cdd--Continued
Test hole 3029

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
	Till, moderate olive-brown to light-olive gray, partly oxidized contains much shale (Tongue River) below 70 feet-----	32	92
Tongue River Formation:			
	Shale, dusky-yellow to light-olive-gray, oxidized to partly oxidized, contains some very fine to fine calcareous sand-----	8	100

161-101-35add
Test hole 3004

Glacial drift:			
	Gravel and sand, medium sand to cobbles sub- rounded to rounded-----	10	10
	Till, dark-greenish-gray, some oxidation between 30 and 35 feet-----	43	53
	Silt, dark-greenish-gray with some black, some fine sand, very calcareous, few rootlets (possibly a swamp deposit)-----	27	80
	Gravel, unsorted-----	1	81
	Sandstone, light-olive to light-olive-brown, very fine to medium, oxidized, cemented-----	2	83
	Till, dark-greenish-gray-----	9	92
Tongue River Formation:	Clay, sandy, grayish-green, slightly indurated---	8	100

161-102-9ddd
Test hole 2248

Glacial drift:			
	Soil, gravelly, black-----	1	1
	Gravel, fine to medium, moderately sorted, sub- angular to subrounded, oxidized-----	4	5
	Clay, silty, yellowish-brown, oxidized-----	31	36
	Clay, silty, olive gray; some of the larger cut- tings appear to be bedded-----	304	340
	Clay, silty, olive gray and dark olive gray, shale clay (apparently interbedded)-----	141	481
	Gravel, (drill action)-----	5	486
	Clay, silty, olive gray and dark olive gray-----	51	537
	Samples from below 340 feet are very poor-----		
	Till, olive gray (with purple tinge), very hard-----		Sidewall core 500
	Clay, sandy, olive gray, calcareous (till?) (side- wall core barrel tripped between 515 and 530 feet. Exact depth not determined)-----		
	Tongue River Formation (from drill action)-----		537
	Sand, very fine, clayey, light olive gray to light greenish gray, calcareous, friable-----	30	567

161-102-19cbb
Test hole 3006

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
	Sand, gravelly to clayey, some dark-yellowish-orange till-----	5	5
	Sand, gravelly, subrounded, many shale pebbles in lower eight feet-----	28	33
	Till, dark-greenish-gray-----	37	70
	Silt, dark-greenish-gray, some very fine sand and hard clay, calcareous-----	25	95
	Clay, silty, olive and dark-greenish-gray, calcareous-----	21	116
	Boulder-----	1	117
	Till, dark-greenish-gray-----	49	166
	Silt, dark-greenish-gray, calcareous, cohesive, contains some lignite, organic matter and mica flakes-----	118	284
	Gravel, rounded, brownish-pebbles, lignite and "scoria"-----	5	289
	Silt, dark-greenish-gray, calcareous, slightly cohesive; contains lignite, very fine sand and few small pebbles-----	26	315
	Gravel, rounded; predominantly brownish quartzite and igneous pebbles, some pyritic cemented-----	37	352
Tongue River Formation:			
	Clay, olive-gray and dark-greenish-gray, hard-----	18	370

161-102-27aaa
Test hole 3080

Glacial drift:			
	Till, moderate-yellow-brown, oxidized-----	4	4
	Silt, dark-yellowish-brown, calcareous, oxidized-----	21	25
	Till, dark-greenish-gray-----	19	44
	Silt, olive to light-olive-gray, laminated; contains some fine sand and clay; some laminations are calcareous-----	41	85
	Till, olive-gray-----	57	142
	Gravel, fine sand to medium pebbles, subangular to rounded-----	5	147
	Till, olive-gray-----	28	175
	Silt, clayey, olive-gray with black spots, calcareous, locally sandy, lignitic-----	237	412
	Sand, clayey, very fine, calcareous, lignitic-----	18	430
	Silt, clayey, olive-gray with black spots-----	20	450
	Sand, clayey, very fine to medium, calcareous, lignitic, micaceous, wood fibers-----	38	488
	Gravel, granule to boulders, predominantly well rounded brownish-stained and oxidized siliceous pebbles-----	17	505
Tongue River Formation:			
	Silt, sandy, greenish-gray and brownish-black, lignitic very poor sample-----	30	535

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil-----		3	3
Till, olive-brown, oxidized, contains limestone, granite and shale granules-----		20	23
Till, dark-greenish-gray; contains quartz, lime- stone granite and shale granules-----		13	36
Gravel and sand, fine sand to large pebbles, sub- rounded to rounded, some clay or till-----		23	59
Very poor samples above 80'			
Till, dark-greenish-gray-----		83	142
Gravel, granular, subrounded-----		1	143
Clay, shaley, olive-gray, calcareous, cohesive, hard; contains gravel or sand lenses, also abundant lignite particles below 255 feet-----		205	348
Gravel, chips, predominantly brown chips of quartz and quartzite with some limestone and mafic igneous chips-----		10	358
Tongue River Formation:			
Sandstone, silty, light-olive-gray, very fine, some lignitic material-----		27	385

162-103-10dcb
Sven Bervik

(Log furnished by Marinus Jensen)

Gravel-----	83	83
Clay, blue, and sand-----	11	94
Clay, blue-----	44	138
Gravel-----	6	144

162-103-25bbb
Test hole 3007

Glacial drift:			
Gravel and sand, medium sand to large pebbles, rounded, oxidized, abundant limestone and granitic pebbles-----	54	54	
Clay, sandy, oxidized-----	4	58	
Sand, clayey, very fine to very coarse (poor samples)-----	27	85	
Sand and gravel; pebbles predominantly shale and limestone-----	19	104	
Till, dark-greenish-gray-----	31	135	
Till, moderate-olive-brown, partly oxidized; a- bundant lignite particles, and limestone and shale grains-----	19	154	
Tongue River Formation:			
Clay, slightly silty, dusky-yellow-green and medium bluish gray, slightly oxidized, hard; also some interbedded, oxidized, very fine, silty sand-----	15	169	
Lignite-----	6	175	
Sand, silty to very fine, partly oxidized-----	5	180

Till, sandy, moderate to dark-yellowish-brown, oxidized-----	45	45	
Till, olive-gray-----	28	73	
Gravel, coarse sand to medium pebbles, angular to rounded; predominantly granite and limestone, some quartz and shale and minor lignite and pyrite-----	7	80	
Till, olive-gray-----	60	140	
Gravel, coarse sand and small pebbles, subrounded to rounded; predominantly shale and limestone-----	5	145	
Sand, fine to very coarse, subrounded-----	10	155	

163-100-13bbb--Continued
Test hole 3076

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
Till, olive-gray		25	180
Gravel, medium sand to medium pebbles, subrounded; interbedded with olive-gray till or clay (about 40 percent)		32	212
Till, olive-gray; interbedded thin gravel lenses		11	223
Till, olive-gray		167	390
Tongue River Formation:			
Sand, very silty, greenish-gray, micaceous, lignitic, locally calcareous; some greenish-gray clay		25	415

Test hole 3012

Glacial drift:

Till, dark-yellowish-orange to grayish-olive, oxidized, less oxidized with depth; contains selenite crystals	44	44
Silt, moderate-olive-brown, calcareous	5	49
Till, dark-greenish-gray, some very silty areas	149	198
Gravel and sand	8	206
Till, dark-greenish-gray; a few sand and gravel lenses; (several boulders encountered between 230 and 360 feet, very poor samples from this depth)	179	385
Gravel and sand, fine sand to medium pebbles, angular to rounded	45	430
Silt, sandy dark-greenish-gray	12	442
Gravel and sand, very coarse sand to fine gravel, subangular, contains a few scoria fragments	16	458
Silt, sandy, dark-greenish-gray; contains some lignite	39	497
Tongue River Formation:		
Sandstone, clayey, dusky-yellow, oxidized	23	520

Test hole 3008

<u>Formation</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
	Sand, silty to fine, abundant lignite particles--	11	202
	Till, light-olive-gray to light-olive-brown, slightly oxidized-----	8	210
	Sand and gravel, coarse sand and small pebbles, abundant brownish pebbles, and some lignite, scoria, and pyrite-----	26	236
Tongue River Formation:			
	Sand, silty to fine, light-olive-brown, oxidized and bluish gray, unoxidized-----	14	250

163-102-33cdc,
Test hole 3010

Glacial drift:			
	Gravel and sand, medium sand to cobbles, oxidized	7	7
	Till, dark-greenish-gray-----	9	16
	Gravel-----	1	17
	Till, dark-greenish-gray-----	10	27
	Gravel, coarse sand to cobbles, rounded; abundant limestone pebbles-----	13	40

163-102-33cdd,
Test hole 2244

Glacial drift:			
	Soil, gravelly loam, black-----	1	1
	Clay, silty and sandy, dark brown-----	4	5
	Gravel, sandy, poorly sorted, subangular to subrounded-----	22	27
	Till, silty, olive gray-----	15	42
	Sand, medium to very coarse with some pebbles, poorly sorted, subrounded-----	18	60
	Gravel, fine to coarse, poorly sorted, sub- rounded-----	15	75
	Till, olive-gray-----	51	126
	Clay, sandy, dusky yellow green, partially oxi- dized (thin coarse sand and fine gravel lenses were encountered but only a few sand grains and granules were found in samples)-----	49	175
	Gravel, dark brown, fine to coarse, well sorted, subrounded-----	24	199
Tongue River Formation:			
	Shale, olive gray to greenish gray, moderately hard-----	11	210
	Shale, light greenish gray to greenish gray-----	10	220

Table 5.-Chemical analyses of water in Divide County, North Dakota.

Source of water: p, pre-Cretaceous; K, Cretaceous Dakota Sandstone; T, Tertiary Tongue River Formation; Q, Quaternary Holocene (?) gravel; Qd, Quaternary glacial drift. Analytical Results: Abs, absent; -, trace. Remarks: Analyses by North Dakota State Laboratory Department, Bismarck, N. Dak., unless otherwise noted; b, analysis by U. S. Geological Survey; c, elevation difference exceeds 1 percent of total equivalent per million.

(Analysed results in parts per million, except as indicated)
