GEOLOGY AND GROUND WATER RESOURCES OF GRAND FORKS COUNTY, NORTH DAKOTA
PART II - GROUND WATER BASIC DATA

By

T. E. Kelly

INTRODUCTION

Purpose and Scope

The purposes of the investigation of the geology and ground-water resources of Grand Forks County, N. Dak. (fig. 1) were to determine the location and extent of the ground-water reservoirs (aquifers); to evaluate the occurrence and movement of ground water, including the sources of recharge and discharge; and to determine the chemical quality of the ground water. The investigation should provide sufficient information about the occurrence of ground water to plan its safe and intelligent development for irrigation, domestic, industrial, and municipal purposes.

The investigation was made cooperatively by the U.S. Geological Survey, North Dakota State Water Commission, North Dakota Geological Survey, and the Grand Forks County Board of Commissioners. The results of the investigation will be published in three separate parts of the bulletin series of the North Dakota Geological Survey and the county ground-water studies series of the North Dakota State Water Commission. Part I is an interpretive report describing the geology, Part II is a compilation of the ground-water basic data, and Part III is an interpretive report describing the ground-water resources. Part II makes available hydrologic data collected during the county investigation and functions as a reference for Parts I and III.

The information in this report was collected chiefly between 1964 and 1967 and consists of the following: (1) data on about 1,000 wells, springs, and test holes; (2) water-level measurements in 69 observation wells; (3) logs of about 160 test holes and selected wells; and (4) chemical analyses of 96 water samples.

The data in this report are useful for predicting geologic and ground-water conditions in Grand Forks County. For example; a person considering the construction of a new well can locate the proposed site on plate 1. The characteristics of nearby wells may be determined from table 1, and the water-level fluctuation in the area may be determined from table 2. The type of material encountered in nearby wells may be determined from table 3, and the chemical quality of water in adjacent wells may be determined from table 4. Extrapolations based on these data should be conservative because of the irregular distribution of the water-bearing rocks.

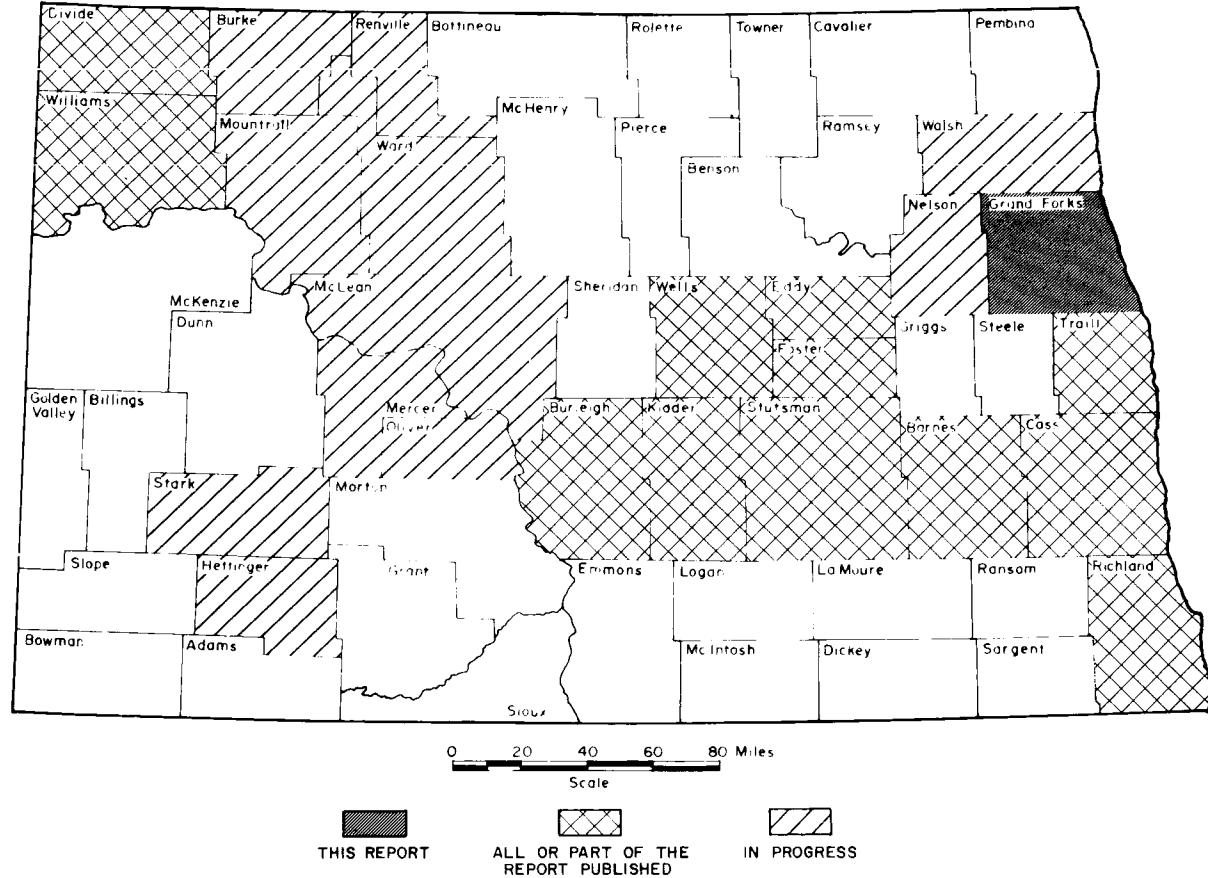

Figure 1. Location of county ground-water studies.

Well-Numbering System

The wells, springs, and test holes in the tables are numbered according to a system based on the location in the public land classification of the U.S. Bureau of Land Management. It is illustrated in figure 2. The first numeral denotes the township north of a base line, the second numeral denotes the range west of the fifth principal meridian, and the third numeral denotes the section in which the well is located. The letters a, b, c, and d designate, respectively, the northeast, northwest, southwest, and southeast quarter sections, quarter-quarter sections, and quarter-quarter-quarter-sections (10-acre tract). For example, well 149-51-15aaa is in the NE¹₄NE¹₄NE¹₄ sec. 15, T. 149 N., R. 51 W. Consecutive terminal numerals are added if more than one well is recorded within a 10-acre tract. The location of each well, spring, and test hole listed in the tables is shown on plate 1 (in pocket).

Acknowledgments

The cooperation of the residents of the county and the municipal and county officials is gratefully acknowledged. Most of the test hole logs used in this report were based on well-site analyses made by Alain Kahil and Clifford Beeks of the North Dakota State Water Commission.

Thanks is due to the numerous well drillers and engineers who contributed logs and information for this report.

EXPLANATION OF TABLES

Water levels in observation wells were measured periodically beginning in the summer of 1964. During most of 1965 and 1966, from 70 to 80 wells were measured each month, and 4 wells were equipped with continuous water-level recorders. About 10 of these observation wells will continue to be measured as part of the statewide observation well network. The locations of observation wells are shown on plate 1.

The logs given in table 3 were prepared from sample description logs obtained for all test holes drilled for this project. Visual examination, when the samples were obtained during drilling of the hole, was made by using a binocular microscope. Color descriptions were determined by comparing the sample with the Geological Society of America rock-color chart (1963). Grain-size determinations used in the logs refer to the Wentworth (1922) size scale. Nearly all of the samples reacted (effervesced) when treated with diluted hydrochloric acid and therefore were considered calcareous. Any variation in the amount of calcareousness was noted on the sample logs in table 3.

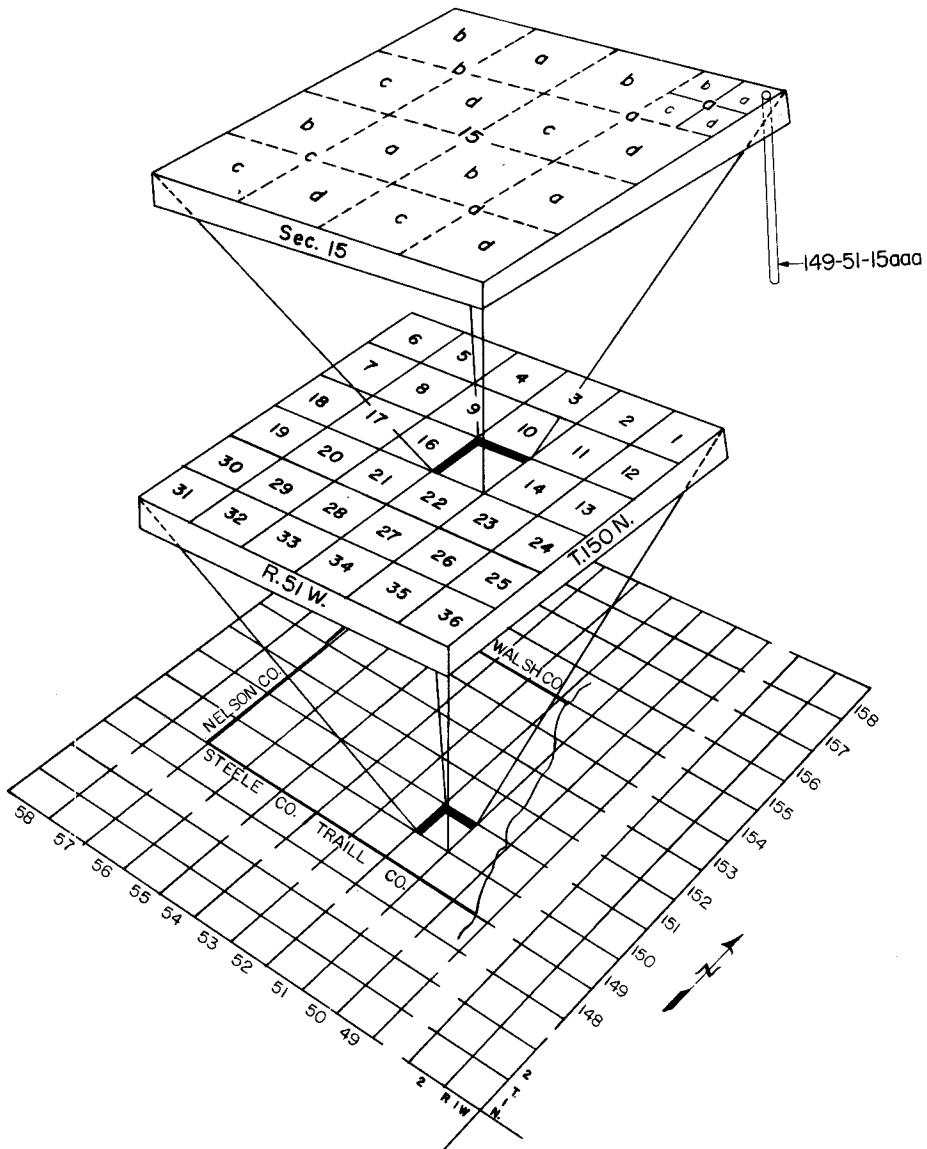

Figure 2. System of numbering wells, springs, and test holes.

The term "till" indicates an unsorted, unstratified, cohesive, agglomeration of rock particles ranging from clay to boulders. Generally clay is the dominant particle size. If a particle size other than clay is present in appreciable amounts, that particle size is used as a modifying term. Consequently, terms such as silty, sandy, or gravelly are textural terms used to indicate that the material described contains an appreciable but not a dominant amount of the modifying material.

The lithologic descriptions for U.S. Geological Survey and North Dakota State Water Commission test holes in table 3 are a composite from the driller's log, sample analysis log, and electric log (where available). The other logs are from various sources, and are mostly driller's logs. The stratigraphic nomenclature used in this report is that of the North Dakota Geological Survey and, in some instances, differs from that of the U.S. Geological Survey.

WATER-QUALITY DATA

All natural waters contain dissolved mineral matter. Water in contact with soils or rock, even for only a few hours, will dissolve some mineral matter. The quantity of dissolved mineral matter in a natural water depends primarily on the type of rocks or soils with which the water has been in contact and the length of time of contact. Ground water is generally more highly mineralized than surface water because it remains in contact with the rocks and soils for much longer periods.

The mineral constituents and physical properties of natural waters reported in the table of analyses include those that have a practical bearing on the value of the waters for most purposes. The analyses generally include determinations of silica, iron, calcium, magnesium, sodium, potassium (or sodium and potassium together calculated as sodium), alkalinity as carbonate and bicarbonate, sulfate, chloride, fluoride, nitrate, boron, dissolved solids, pH, and specific conductance. The source and significance of the different constituents and properties of natural waters are discussed in the following paragraphs.

Mineral Constituents in Solution

Silica (SiO_2)

Silica is dissolved from practically all rocks. Some natural waters contain less than 5 ppm (parts per million) of silica and few contain more than 50 ppm, but the more common range is from 10 to 30 ppm. Silica affects the usefulness of a water because it contributes to the formation of scale in pipes, water heaters, and boilers.

Iron (Fe)

Iron is dissolved from many rocks and soils. On exposure to air, normal basic waters that contain more than 1 ppm of iron soon become turbid with the insoluble reddish ferric oxide produced by oxidation. Surface waters, therefore, seldom contain as much as 1 ppm of dissolved iron, although some acid waters carry large quantities of iron in solution. Ground waters commonly contain up to 10 ppm. Rarely, concentrations over 50 ppm may occur in waters with a pH of 5 to 8 (Hem, 1959). Iron causes reddish-brown stains on porcelain or enameled ware and fixtures and on fabrics washed in the water. The U.S. Public Health Service (1962) recommends an upper limit of 0.3 ppm of iron in drinking water.

Calcium (Ca)

Calcium is dissolved from almost all rocks and soils. Calcium and magnesium cause hard water and are largely responsible for the formation of scale in pipes, water heaters, and boilers. Water associated with granite or silicious sands may contain less than 10 ppm of calcium, whereas water associated with dolomite and limestone may contain from 30 to 100 ppm. Water that has been in contact with deposits of gypsum may contain several hundred parts per million of calcium.

Magnesium (Mg)

Magnesium is dissolved from many rocks, particularly from dolomitic rocks. Its effect in water is similar to that of calcium. The magnesium in soft waters may amount to only 1 or 2 ppm, but water in areas that contain large quantities of dolomite or other magnesium-bearing rocks may contain from 20 to 100 ppm or more of magnesium.

Sodium and potassium (Na and K)

Sodium and potassium are dissolved from practically all rocks. Sodium is the predominant cation in some of the more highly mineralized waters found in the western United States. Natural waters that contain only 3 or 4 ppm of the two together are likely to carry almost as much potassium as sodium. As the total quantity of these constituents increases, the proportion of sodium becomes much greater. However, the potassium concentration in water does not often exceed 50 ppm. Moderate quantities of sodium and potassium have little effect on the usefulness of the water for most purposes, but waters that carry more than 50 or 100 ppm of the two may require careful operation of steam boilers to prevent foaming. More highly mineralized waters that contain a large proportion of sodium salts may be unsatisfactory for irrigation. The presence

of several hundred parts per million of sodium in water makes it unsuitable for use in sodium-restricted diets used as therapy for cardiovascular diseases.

Bicarbonate and carbonate (HCO_3 and CO_3)

Bicarbonate and carbonate are sometimes reported as alkalinity. Since the major causes of alkalinity in most natural waters are carbonate and bicarbonate ions dissolved from carbonate rocks, the results are usually reported in terms of these constituents. Although alkalinity is primarily due to the presence of carbonate and bicarbonate, other ions also contribute to alkalinity such as silicates, phosphates, borates, possibly fluoride, and certain organic anions which may occur in colored waters. The significance of alkalinity to the domestic, agricultural, and industrial user is usually dependent upon the nature of the cations (Ca, Mg, Na, K) associated with it. However, moderate amounts of alkalinity do not adversely affect most use.

Sulfate (SO_4)

Sulfate is dissolved from many rocks and soils--in especially large quantities from gypsum and from beds of shale. It is formed also by the oxidation of sulfides of iron and may therefore be present in considerable quantities in mine waters. The concentration of sulfate in waters is generally limited to about 1,500 ppm by the solubility of calcium sulfate. Sulfate in waters that contain much calcium and magnesium causes the formation of hard scale in steam boilers and may increase the cost of softening the water. The U.S. Public Health Service (1962) recommends that 250 ppm of sulfate should be the upper limit for drinking water.

Chloride (Cl)

Chlorides are generally very soluble compounds and are found in most rocks so that chlorides are found in all natural waters. Large quantities of chloride may affect the industrial use of water by increasing the corrosiveness of waters that contain large quantities of calcium and magnesium. The U.S. Public Health Service (1962) recommends an upper limit of 250 ppm of chloride for drinking water.

Fluoride (F)

Fluoride has been reported as being present in igneous and some sedimentary rocks to about the same extent as chloride. However, most fluorides, unlike the chlorides, are low in solubility so that the quantity of fluoride in natural waters is ordinarily very small compared to that of chloride. Hem (1959) reported that fluoride concentrations in excess of 10 ppm are rare. Investigations have proved that fluoride concentrations of about 0.6 to 1.7 ppm reduced the incidence of dental caries and that concentrations

greater than 1.7 ppm also protect the teeth from cavities but cause an undesirable black stain (Durfor and Becker, 1964). U.S. Public Health Service (1962, p. 8) states, "When fluoride is naturally present in drinking water, the concentration should not average more than the appropriate upper control limit (0.6 to 1.7 ppm). Presence of fluoride in average concentrations greater than two times the optimum shall constitute grounds for rejection of the supply." Concentration higher than the stated limits may cause mottled enamel in teeth, endemic cumulative fluorosis, and skeletal effects.

Nitrate (NO_3)

Nitrate in water is considered a final oxidation product of nitrogenous material and may indicate contamination by sewage or other organic matter. U.S. Public Health Service (1962) sets 45 ppm as the upper limit for nitrate. Ingestion of excessive quantities of nitrate may result in infantile methemoglobinemia. If the concentration is sufficiently great, both man and animals can be poisoned by nitrate.

Boron (B)

Boron in small quantities has been found essential for plant growth, but irrigation water containing more than 1 ppm boron is detrimental to navy beans and other boron-sensitive crops.

Dissolved solids

The reported quantity of dissolved solids--the residue on evaporation--consists mainly of the dissolved mineral constituents in the water. It may also contain some organic matter and water of crystallization. Waters with less than 500 ppm of dissolved solids are usually satisfactory for domestic and some industrial uses. Water containing several thousand parts per million of dissolved solids are sometimes successfully used for irrigation where practices permit the removal of soluble salts through the application of large volumes of water on well-drained lands, but generally water containing more than about 2,000 ppm is considered to be unsuitable for long-term irrigation under average conditions.

Properties and Characteristics of Water

Temperature

Temperature is an important factor in properly determining the quality of water. This is very evident for such a direct use as an industrial coolant. Temperature is also important, but perhaps not so evident, for its indirect influence upon concentrations of dissolved gases and distribution of chemical solutes in ground water. Normally, the

temperature of ground water within 60 feet of the surface approximates the mean annual air temperature and increases 1°F for each 60 to 100 feet increase with depth.

Hardness

Hardness is the characteristic of water that receives the most attention in industrial and domestic use. It is commonly recognized by the increased quantity of soap required to produce lather. The use of hard water is also objectionable because it contributes to the formation of scale in boilers, water heaters, radiators, and pipes, with the resultant decrease in rate of heat transfer, possibility of water heater or boiler failure, and loss of flow.

Hardness is caused almost entirely by compounds of calcium and magnesium. Other constituents--such as iron, manganese, aluminum, barium, strontium, and free acid--also cause hardness, although they usually are not present in quantities large enough to have any appreciable effect.

Generally, bicarbonate and carbonate determine the proportions of "carbonate" hardness of water. Carbonate hardness is the amount of hardness chemically equivalent to the amount of bicarbonate and carbonate in solution. Carbonate hardness is approximately equal to the amount of hardness that is removed from water by boiling and is termed temporary hardness.

Noncarbonate hardness is the difference between the hardness calculated from the total amount of calcium and magnesium in solution and the carbonate hardness. If the carbonate hardness (expressed as calcium carbonate) equals the amount of calcium and magnesium hardness (also expressed as calcium carbonate) there is no noncarbonate hardness. Noncarbonate hardness is about equal to the amount of hardness remaining after water is boiled. The scale formed at high temperatures by the evaporation of water containing noncarbonate hardness commonly is tough, heat resistant, and difficult to remove.

Although many people talk about soft water and hard water, there has been no firm line of demarcation. Water that seems hard to an easterner may seem soft to a westerner. The Geological Survey has adopted the following classification:

<u>Hardness range (calcium carbonate in ppm)</u>	<u>Hardness description</u>
0-60	Soft
61-120	Moderately hard
121-180	Hard
more than 180	Very hard

For public use, water with hardness about 200 ppm generally requires softening treatment (Durfor and Becker, 1964).

Sodium-adsorption ratio (SAR)

The term "sodium-adsorption ratio (SAR)" was introduced by the U.S. Salinity Laboratory Staff (1954). It is a ratio expressing the relative activity of sodium ions in exchange reaction with soil and is an index of the sodium or alkali hazard to the soil. Sodium-adsorption ratio is expressed by the equation:

$$SAR = \frac{Na^+}{\sqrt{\frac{Ca^{++} + Mg^{++}}{2}}}$$

where the concentrations of the ions are expressed in milliequivalents per liter (or equivalents per million for most irrigation waters).

Waters are divided into four classes with respect to sodium or alkali hazard: low, medium, high, and very high, depending upon the SAR and specific conductance. At a conductance of 100 micromhos per centimeter the dividing points are at SAR values of 10, 18, and 26; but at 5,000 micromhos the corresponding dividing points are SAR values of approximately 2.5, 6.5, and 11. Waters range in respect to sodium hazard from those which can be used for irrigation on almost all soils to those which are generally unsatisfactory for irrigation.

Specific conductance (micromhos per centimeter at 25°C)

Specific conductance is a convenient, rapid determination used to estimate the amount of dissolved solids in water. It is a measure of the ability of water to conduct an electrical current. Commonly, the amount of dissolved solids (in parts per million) is about 65 percent of the specific conductance (in micromhos). This relation is not constant from well to well and it may even vary in the same source with changes in the composition of the water (Durfor and Becker, 1964).

Specific conductance of most waters in the eastern United States is less than 1,000 micromhos, but in the arid western parts of the country, a specific conductance of more than 1,000 micromhos is common.

Hydrogen-ion concentration (pH)

Hydrogen-ion concentration is expressed in terms of pH units. The values of pH often are used as a measure of the solvent power of water or as an indicator of the chemical behavior certain solutions may have toward rock minerals.

The degree of acidity or alkalinity of water, as indicated by the hydrogen-ion concentration, expressed as pH, is related to the corrosive properties of water and is useful in determining the proper treatment for coagulation that may be necessary at water-treatment plants. A pH of 7.0 indicates that the water is neither acid nor alkaline. Readings progressively lower than 7.0 denote increasing acidity and those progressively higher than 7.0 denote increasing alkalinity. The pH of most natural ground waters ranges between 5.5 and slightly more than 8.

TABLE 1.--Records of wells, springs, and test holes

Depth of well: Measured depths are given in feet and tenths or hundredths, reported depths in feet, below land surface.

Type of well: B, bored; Dr, drilled; Du, dug; Dv, driven; Sp, spring.

Depth to water: Measured depths are given in feet and tenths or hundredths, reported depths in feet, below land surface.

Use of water or well: D, domestic; I, irrigation; Ind, industrial; O, observation, water levels shown in table 2; PS, public supply; S, stock, T, test hole; U, unused.

Aquifer: Kd, Dakota Group; Kp, Pierre Formation; Qd, glacial drift and associated sand and gravel deposits; Qev, Elk Valley delta sand and gravel deposits; Qla, Lake Agassiz silt, sand, and gravel deposits.

Depth to bedrock: Maximum depth at which palatable water may be obtained.

Remarks: C, chemical analysis is shown in table 4; L, log of test hole or well shown in table 3; flow rates were measured unless shown as reported.

TABLE 3.--Logs of test holes and selected wells

149-49-7ddd

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
	Soil, brownish-black, clayey-----	1	1
	Silt, brownish-gray, clayey, oxidized-----	6	7
	Clay, brownish-gray, silty, oxidized-----	8	15
	Clay, medium-gray to olive-gray, silty, slightly calcareous-----	10	25
	Clay, olive-gray, silty, noncalcareous; lam- inated silt-----	50	75
	Till, olive-gray, very clayey-----	53	128
	Clay, olive-gray, slightly silty, very plastic-----	29	157
	Till, olive-gray to medium-dark-gray, sandy, cohesive-----	18	175
	Gravel, fine to medium, subangular to sub- rounded, sandy to bouldery; olive-gray sandy till from 195 to 197-----	30	205
	Till, olive-gray to medium-dark-gray, sandy; interstratified gravel deposits-----	23	228
	Gravel, coarse, subangular to subrounded; minor amounts of sand-----	17	245
	Till, light-olive-gray, sandy, oxidized(?)-----	5	250
	Till, brownish-gray, sandy-----	10	260
	Sand, medium to coarse, poorly sorted, sub- angular quartzose; interstratified gravel---	5	265
	Till, light-olive-gray to olive-gray, sandy-----	3	268
Precambrian:			
	Schist, greenish-gray to dark-greenish-gray, clayey, containing white feldspar and dark- green amphibole crystals-----	2	270

149-49-32aaa

Glacial drift:			
	Soil, dusky-brown-----	1	1
	Silt, yellowish-gray, clayey, oxidized-----	16	17
	Clay, light-olive-gray, unoxidized-----	42	59
	Till, olive-gray, silty-----	100	159
	Till, olive-gray; contains sand and gravel-----	13	172
	Sand, fine to medium, clayey; contains coarse sand and fine gravel-----	5	177
	Till, olive-black, silty; contains small amount of gravel-----	68	242
Dakota Group:			
	Clay, pale-pink, silty, noncalcareous; scattered quartz grains-----	31	273

149-50-7cdc

Glacial drift:			
	Soil, black, silty-----	2	2
	Silt, dark-yellowish-gray to light-brown, oxidized-----	5	7
	Till, mottled dark-yellowish-orange to light- brown, oxidized-----	14	21
	Till, olive-gray, clayey, plastic-----	59	80
	Clay, olive-gray, very plastic, moderately calcareous-----	7	87

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:--Continued			
	Sand, fine to medium, poorly sorted, subrounded quartzose-----	4	91
	Till; poor samples-----	32	123
	Sand, very fine to medium, poorly sorted, subangular to subrounded, quartzose; interstratified gravel near base-----	17	140
	Gravel, fine to very coarse, poorly sorted, bouldery-----	14	154
	Till, olive-gray; poor samples-----	17	171
	Sand, fine to coarse, poorly sorted, subangular to subrounded, quartzose-----	4	175
	Till, olive-gray, silty to sandy, cohesive, very calcareous-----	18	193
	Silt, olive-gray, cohesive, noncalcareous-----	2	195
	Sand; poor samples-----	4	199
	Silt, olive-gray, clayey, cohesive-----	9	208
	Till, olive-gray, silty to sandy, cohesive-----	34	242
	Till, olive-gray, clayey to silty, cohesive-----	20	262
	Clay, olive-gray, silty; speckled brownish-gray-----	35	297
	Till, dark-yellowish-brown to brownish-gray, sandy, very calcareous; driller reports interstratified gravel-----	13	310
Winnipeg Group:			
	Clay, mottled or interbedded grayish-orange-pink to light-brown and light-greenish-gray, cohesive, very calcareous; interstratified limestone, poor recovery-----	5	315

Glacial drift:			
	Soil, dusky-brown, silty-----	1	1
	Silt, yellowish-gray, clayey, oxidized-----	15	16
	Clay, light-olive-gray, unoxidized-----	37	53
	Till, olive-gray, silty-----	85	138
	Till, olive-gray, sandy-----	7	145
	Till, light-olive-gray, sandy, very calcareous; contains coarse sand and fine gravel-----	34	179
	Clay, olive-gray, silty, very calcareous-----	26	205
	Sand, fine to medium, gravelly-----	2	207
	Till, olive-gray, silty; contains some sand and gravel-----	67	274
	Till, light-olive-gray, silty; contains sand and gravel-----	41	315
Precambrian:			
	Chlorite schist, greenish-black; contains light-green, calcareous clay-----	6	321

Glacial drift:			
	Soil, black, silty-----	1	1
	Silt, yellowish-gray, clayey, oxidized-----	9	10
	Till, olive-gray, silty, unoxidized-----	55	65
	Clay, olive-gray-----	6	71
	Till, olive-gray, silty-----	7	78
	Clay, greenish-gray; contains light-gray silt laminae-----	14	92
	Till, olive-gray, silty-----	41	133
	Till, olive-gray, silty; contains very fine sand-----	25	158

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
	Soil, black, clayey-----	1	1
	Till, dusky-yellow, silty, oxidized-----	15	16
	Till, olive-gray, silty, unoxidized-----	44	60
	Till, olive-gray, silty; contains some sand and gravel-----	21	81
	Till, olive-gray, silty-----	10	91
	Clay, olive-gray, silty; very fine to fine sand-----	31	122
	Clay, olive-gray, silty-----	18	140
	Till, dusky-yellowish-brown, silty-----	15	155
	Clay, grayish-black, silty-----	9	164
	Till, olive-gray, silty to very silty-----	69	233
	Sand, medium to coarse, gravelly-----	6	239
	Till, olive-gray, silty to very silty-----	53	292
	Sand, fine to medium, gravelly-----	21	313
	Clay, olive-gray, very silty-----	9	322
Dakota Group:			
	Sand, medium, well-sorted, quartzose; inter- bedded light-brownish-gray, silty clay-----	51	373
	Clay, yellowish-gray, silty-----	4	377
Winnipeg Group:			
	Limestone, yellowish-gray-----	1	378

Glacial drift:			
	Sand, fine, quartzose, angular, oxidized; minor amounts of gravel-----	9	9
	Sand, fine to medium, subangular, unoxidized---	6	15
	Till, dark-greenish-gray to olive-gray, silty--	27	42

Glacial drift:			
	Soil, black, sandy-----	1	1
	Sand, very fine to fine, poorly sorted-----	4	5
	Silt, light-olive-brown, clayey, oxidized-----	5	10
	Silt, olive-gray, clayey to sandy, unoxidized--	14	24
	Till, olive-gray, very silty-----	33	57
	Till, olive-gray, sandy, becoming very silty with depth-----	77	134
	Silt, olive-gray, clayey to sandy, laminated--	15	149
	Clay, olive-gray, silty-----	6	155
	Till, olive-gray, silty-----	13	168

149-53-14bae

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil, black, sandy-----	1	1	
Sand, very fine, poorly sorted, angular, quartzose, oxidized-----	9	10	
Silt, pale-yellowish-brown, clayey, oxidized-----	3	13	
Silt, olive-gray, clayey to sandy, unoxidized-----	51	64	
Till, olive-gray, silty-----	83	147	
Silt, olive-gray to dark-greenish-gray, clayey-----	12	159	
Till, olive-gray, silty-----	77	236	
Gravel, poorly sorted, sandy-----	2	238	
Till, olive-gray, silty; poor sample return-----	54	292	
Belle Fourche Formation:			
Shale (?); poor samples-----	6	298	
Limestone and interbedded shale-----	6	304	
Shale, olive-gray, very sandy; sandstone laminae-----	22	326	

149-53-28ccc

Glacial drift:			
Soil, black, sandy-----	1	1	
Sand, very fine, well-sorted, oxidized-----	20	21	
Silt, dark-greenish-gray, clayey; becomes sandy with depth, unoxidized-----	114	135	
Till, olive-gray, silty; becomes gravelly with depth-----	43	178	
Gravel, fine, sandy-----	21	199	
Till, olive-gray, clayey-----	5	204	
Sand; poor samples-----	2	206	
Till, olive-gray, clayey-----	36	242	
Clay, olive-black, slightly sandy-----	22	264	
Belle Fourche Formation:			
Clay, olive-black, sandy; light-bluish-gray, bentonitic clay; noncalcareous-----	19	283	

149-53-28cdc

Glacial drift:			
Soil, black, clayey-----	1	1	
Clay, grayish-orange-----	7	8	
Sand, fine, poorly sorted, oxidized-----	2	10	
Sand, fine, poorly sorted, unoxidized-----	3	13	
Silt, olive-gray, clayey-----	78	91	
Till, greenish-gray, sandy-----	3	94	
Till, olive-gray, sandy-----	34	128	
Gravel, fine; poor samples-----	1	129	
Till, olive-gray, sandy-----	30	159	
Gravel, very poorly sorted-----	4	163	
Till, olive-gray, gravelly-----	27	190	
Belle Fourche Formation:			
Clay, olive-gray, silty to sandy, very calcareous-----	20	210	

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil, black, sandy-----	1	1	
Sand, very fine to medium, subrounded, oxidized	11	12	
Clay, olive-gray, silty, unoxidized-----	9	21	
Silt, olive-gray, clayey; becomes sandy with depth-----	114	135	
Till, olive-gray, silty-----	11	146	
Till, olive-gray, gravelly-----	14	160	
Gravel, very fine to fine, subrounded-----	4	164	
Till, olive-gray, gravelly; driller reports gravel from 182 to 186-----	33	197	
Till, dark-greenish-gray, sandy-----	16	213	
Belle Fourche Formation:			
Clay, olive-gray, calcareous-----	18	231	

Glacial drift:			
Soil, black, sandy-----	1	1	
Sand, moderate-yellowish-brown, clayey to silty, oxidized-----	17	18	
Sand, olive-gray, clayey to silty, unoxidized--	2	20	
Silt, olive-gray, clayey to silty -----	70	90	
Silt, dark-greenish-gray, clayey-----	40	130	
Till, dark-greenish-gray, silty-----	48	178	
Gravel; poor samples-----	2	180	
Till, olive-gray, silty-----	38	218	
Clay, olive-gray, silty-----	15	233	
Belle Fourche Formation:			
Shale, olive-gray, calcareous-----	19	252	

Glacial drift:			
Soil, black, sandy-----	1	1	
Sand, grayish-orange, clayey to silty-----	3	4	
Sand, grayish-orange, poorly sorted, very fine, silty, oxidized-----	7	11	
Sand, dark-greenish-gray, clayey to sandy, unoxidized-----	34	45	
Till, olive-gray, very silty-----	83	128	
Till, olive-gray; interbedded silt-----	48	176	
Till, olive-gray, silty-----	8	184	
Sand, poorly sorted, coarse to very coarse, gravelly-----	6	190	
Till, olive-gray, gravelly-----	45	235	
Belle Fourche Formation:			
Clay, olive-black, fossiliferous, calcareous---	17	252	

149-54-2cdd

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil, black, silty-----	1	1	
Clay, dusky-yellow, silty, oxidized-----	11	12	
Sand, light-olive-gray, clayey, unoxidized-----	23	35	
Clay, light-olive-gray-----	69	104	
Till, olive-gray, silty-----	26	130	
Sand, coarse, poorly sorted, gravelly-----	3	133	
Till, olive-gray, silty; small amounts of sand and gravel-----	99	232	
Sand, coarse, poorly sorted, gravelly-----	8	240	
Till, olive-gray, silty; interbedded coarse, gravelly sand-----	38	278	
Greenhorn Formation: Clay, yellowish-brown, silty, very calcareous-	26	304	

149-54-4ccc

Glacial drift:			
Soil, black, sandy-----	1	1	
Clay, yellowish-brown, silty, oxidized-----	9	10	
Sand, olive black, fine moderately well-sorted, subangular, unoxidized-----	49	59	
Clay, dark-greenish-gray, silty-----	25	84	

149-54-9bdd2
City of Northwood No. 1

(Log furnished by Layne-Minnesota Co.)

Clay-----	20	20
Quicksand-----	15	35
Sandy clay-----	67	102
Gravelly clay-----	34	136
Boulder clay-----	3	139
Black sand-----	13	152
Boulder clay-----	5	157
Black sand-----	3	160
Boulder clay-----	5	165

149-54-9daci
City of Northwood No. 4

(Log furnished by Layne-Minnesota Co.)

Topsoil-----	2	2
Yellow clay-----	9	11
Black sand, medium dirty-----	20	31
Clean sand (white)-----	7	38
Black sand, medium dirty-----	14	52

149-54-22aab

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
------------------------	-----------------	----------------------------	------------------------

Glacial drift:			
	Soil, brownish-black, silty-----	1	1
	Silt, moderate-yellowish-brown, oxidized-----	11	12
	Silt, olive-gray, unoxidized-----	3	15
	Sand, very fine, quartzose, very silty to clayey-----	14	29
	Clay, pinkish-gray, calcareous-----	13	42
	Clay, olive-gray, silty-----	11	53

149-55-32abb

Glacial drift:			
	Soil, dusky-brown, sandy-----	1	1
	Sand, dusky-yellow, fine, well-sorted, quartzose, oxidized-----	12	13
	Till, dusky-yellow, silty to sandy, oxidized--	8	21
	Till, olive-gray, silty to sandy, unoxidized--	4	25
	Sand, medium to coarse, poorly sorted, gravelly-----	5	30
	Till, olive-gray, silty-----	4	34
	Silt, olive-gray, clayey-----	15	49
	Sand, olive-gray, fine, well-sorted, quartzose-----	10	59
	Gravel, fine to medium, poorly sorted-----	5	64
Niobrara Formation:			
	Clay, light-gray, silty, very calcareous-----	20	84

150-50-7ccd

Glacial drift:			
	Soil, dusky-brown, silty-----	1	1
	Clay, dusky-yellow, silty, oxidized-----	17	18
	Clay, olive-gray, unoxidized-----	11	29
	Till, olive-gray, silty-----	92	121
	Silt, olive-gray, very calcareous-----	15	136
	Till, olive-gray, silty, very calcareous-----	3	139
	Sand, fine to medium grained, gravelly, quartzose; interbedded grayish-green, silty clay-----	18	157

150-50-9ddd

Glacial drift:			
	Soil, dusky-brown, clayey-----	1	1
	Clay, dusky-yellow, oxidized-----	21	22
	Clay, light-olive-gray, unoxidized-----	14	36

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
	Clay, olive-gray, noncalcareous-----	5	41
	Clay, light-olive-gray-----	40	81
	Till, olive-gray, clayey-----	42	123
	Clay, olive-gray, silty-----	22	145
	Sand, medium to coarse, gravelly, moderately well-sorted, subangular to subrounded-----	3	148
	Clay, olive-gray, silty-----	15	163
	Till, olive-gray, clayey-----	8	171
	Clay, olive-gray to olive-black, silty-----	20	191
	Till, dusky-yellowish-brown, silty to very sandy, gravelly-----	20	211
	Sand, fine to medium, moderately well-sorted, gravelly, quartzose-----	17	228
	Till, dusky-yellowish-brown, sandy to gravelly--	37	265
Winnipeg Group:			
	Clay, yellowish-gray and moderately reddish- brown, silty, very calcareous-----	40	305

Glacial drift:			
	Soil, black, silty-----	1	1
	Silty, dark-yellowish-orange to pale-yellowish- brown, clayey, noncalcareous-----	15	16
	Clay, olive-gray, silty, slightly calcareous, unoxidized-----	34	50
	Till, olive-gray, clayey, slightly calcareous---	63	113

	Sand, fine to medium, well-sorted, sub-angular to subrounded, quartzose-----	2	4
	Clay, dusky-yellow to yellowish-gray, silty, very calcareous, oxidized-----	6	10
	Clay, light-olive-gray, slightly calcareous---	25	35
	Till, olive-gray, silty-----	18	53
	Silt, olive-gray, clayey, very calcareous-----	14	67
	Sand, fine, well-sorted, angular to subangular, quartzose-----	7	74

Glacial drift:			
	Soil, dusky-brown, silty-----	2	2
	Silt, dusky-yellow, clayey, slightly calcareous, oxidized-----	11	13
	Clay, light-olive-gray, unoxidized-----	12	25
	Till, olive-gray, silty, very calcareous-----	5	30
	Sand, greenish-black, very fine to fine, angular to subangular, quartzose, silty, very calcareous-----	7	37
	Sand, fine to medium, well-sorted, subangular to subrounded, quartzose-----	8	45
	Till, olive-gray, very calcareous, silty-----	41	86
	Sand, fine to medium, well-sorted, subangular to subrounded-----	17	103
	Sand, medium to coarse, well-sorted, sub-angular to subrounded; interstratified olive-gray, silty, clay-----	5	108
	Limestone boulder-----	2	110
Dakota Group:			
	Sand, yellowish-gray, very fine; inter-stratified olive-gray, silty clay-----	16	126

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
	Soil, black, clayey-----	1	1
	Clay, yellowish-gray, silty, oxidized-----	11	12
	Clay, olive-gray, slightly calcareous, unoxidized-----	13	25
	Till, olive-gray, silty-----	5	30
	Sand, mottled light-olive-gray, coarse, well- sorted, subrounded to rounded, quartzose----	12	42
	Clay, light-olive-gray, slightly silty-----	1	43
	Sand, mottled light-olive-gray, fine to coarse, subrounded to rounded, quartzose----	14	57
	Sand, mottled gray, coarse to very coarse, subrounded to rounded, quartzose-----	19	76
	Gravel, fine to coarse, poorly sorted, subrounded to rounded-----	32	108
	Till, olive-gray, silty, very calcareous-----	28	136
Dakota Group:			
	Clay, brownish-gray to brownish-black, noncalcareous, medium-gray silt laminae near top-----	38	174
	Sand, pale-yellowish-brown, medium, well- sorted, quartzose-----	15	189

Glacial drift:			
	Soil, brownish-black, silty-----	1	1
	Silt, dusky-yellow, clayey, oxidized-----	9	10
	Clay, light-olive-gray, slightly calcareous, unoxidized-----	4	14
	Till, olive-gray, silty-----	14	28
	Sand, very fine to fine, well-sorted, angular to subrounded, quartzose-----	11	39
	Silt, olive-gray, clayey-----	12	51
	Sand, very fine to fine, well-sorted, angular to subrounded, quartzose-----	23	74

152-52-33ddd

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil, brownish-black, silty-----	1	1	
Clay, dusky-yellow, slightly silty, oxidized-----	8	9	
Till, olive-gray, sandy, unoxidized-----	15	24	
Sand, fine to medium, well-sorted, subangular to subrounded, quartzose-----	12	36	
Silt, olive-gray, clayey; interstratified, fine to medium, quartzose sand-----	10	46	
Till, olive-gray, silty; interstratified fine to medium, well-sorted, quartzose, gravel-----	11	57	
Till, olive-gray, silty to sandy-----	58	115	

152-53-27aaa

Glacial drift:			
Soil, black, silty-----	1	1	
Till, moderate-yellowish-brown, silty, oxidized-----	14	15	
Till, olive-gray to dark-greenish-gray, very silty, unoxidized-----	36	51	
Clay, olive-gray, silty-----	6	57	
Gravel, fine to coarse, very poorly sorted, angular to rounded-----	3	60	
Till, olive-gray to dark-greenish-gray, very silty; driller reports gravel from 81 to 83 and 94 to 99-----	45	105	

152-53-36bab
(Log furnished by U.S. Air Force)

Clay-----	15	15
Gravel (dry)-----	2	17
Till (clay & stone)-----	43	60
Clay (gummy, lacustrine)-----	10	70
Sand, fine at top (also silty) and becoming progressively coarser downward to gravel at base. Many shale pebbles-----	25	95
Till, with much gravel-----	15	110

152-54-29ccc

Glacial drift:			
Sand, very fine to fine, moderately poor sorted, angular to rounded, oxidized-----	3	3	
Silt, moderate-yellowish-brown to dark-yellow- ish-brown, clayey to sandy, oxidized-----	7	10	
Sand, very fine to medium, poorly sorted, angular to rounded, oxidized-----	3	13	
Till, olive-gray, silty to sandy, unoxidized---	18	31	

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
	Soil, black, sandy-----	1	1
	Sand, very fine to fine, moderately well-sorted, angular to rounded; interstratified clay; poor samples-----	4	5
	Silt, grayish-orange, clayey to sandy-----	7	12
	Sand, medium, moderately well-sorted, angular to rounded, oxidized-----	2	14
	Sand, medium, moderately well-sorted, angular to rounded, unoxidized-----	60	74
	Gravel, fine to coarse, poorly sorted, angular to rounded, sandy-----	2	76
	Till, dark-greenish-gray to olive-gray, silty--	8	84

Glacial drift:			
	Soil, brownish-black, sandy-----	1	1
	Sand, very fine to coarse, poorly sorted, angular to rounded, oxidized-----	4	5
	Sand, medium to coarse, poorly sorted, angular to rounded, gravelly, oxidized-----	4	9
	Sand, very fine to fine, moderately poor sorted, angular to rounded, oxidized-----	5	14
	Silt, olive-gray to dark-greenish-gray, clayey to sandy, unoxidized-----	6	20
	Till, olive-gray to dark-greenish-gray, unoxidized-----	22	42

Glacial drift:			
	Soil, brownish-gray, silty-----	1	1
	Silt, yellowish-brown, clayey, plastic, oxidized-----	2	3
	Sand, coarse to very coarse, poorly sorted, angular to subrounded, quartzose, gravelly-----	4	7
	Gravel, fine to medium, poorly sorted, subrounded, sandy-----	6	13
	Silt, pale-yellowish-brown to dark-yellowish-brown, clayey, oxidized-----	7	20
	Till, olive-gray, silty, unoxidized-----	38	58
	Till, olive-gray, clayey to silty-----	42	100

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil, black, sandy-----	1	1	
Clay, dusky-yellow, slightly silty, non-calcareous, oxidized-----	4	5	
Sand, fine to medium, well-sorted, subangular to subrounded, oxidized-----	20	25	
Sand, fine to medium, well-sorted, subangular to subrounded, unoxidized-----	23	48	
Clay, light-olive-gray, slightly calcareous-----	5	53	
Till, olive-gray, silty to sandy, very calcareous-----	55	108	
Carlile Formation:			
Shale, grayish-black, hard, noncalcareous, silty-----	18	126	

Glacial drift:			
Soil, brownish-black, clayey-----	1	1	
Till, moderate-yellowish-brown, clayey to silty, oxidized-----	8	9	
Till, dark-greenish-gray, very sandy-----	11	20	
Till, olive-gray, very silty-----	12	32	

Glacial drift:			
Soil, brownish-black, sandy-----	1	1	
Sand, fine, subangular to subrounded, quartzose, oxidized-----	8	9	
Clay, pale-yellowish-brown, oxidized-----	5	14	
Sand, fine, subrounded to rounded, oxidized; shale fragments predominate-----	5	19	
Sand, very fine to fine, subangular to subrounded, quartzose, oxidized-----	9	28	
Sand, very fine to fine, subangular to subrounded, quartzose, unoxidized-----	3	31	
Sand, fine to medium, subangular to subrounded, quartzose-----	7	38	
Sand, medium to very coarse, angular to subangular, quartzose, gravelly-----	13	51	
Sand, fine to medium, subangular to subrounded; shale fragments predominate-----	19	70	
Silt, dark-gray, moderately calcareous, clayey-----	14	84	

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
	Soil, brownish-black, sandy-----	1	1
	Sand, dark-yellowish-brown, medium, poor to moderately sorted, quartzose, silty-----	9	10
	Sand, mottled moderate-brown, coarse, moderately sorted, subangular, oxidized-----	10	20
	Sand, mottled medium-gray, fine to very coarse, subangular to subrounded, unoxidized-----	22	42
	Sand, mottled medium-gray, fine to medium, subrounded-----	6	48
	Sand, mottled medium-gray, fine to very coarse, subrounded; shale fragments predominate-----	4	52
	Sand, mottled medium-gray, coarse, well-sorted, subrounded; shale fragments predominate-----	10	62
	Silt, dark-greenish-gray, slightly calcareous--	22	84

Glacial drift:	Roadfill-----	2	2
	Sand, very fine, subangular quartzose, silty, oxidized-----	8	10
	Sand, fine, subangular to subrounded, quartzose, oxidized-----	10	20
	Sand, very fine to fine, angular to sub-angular, quartzose, oxidized-----	4	24
	Sand, very fine to fine, angular to sub-angular, quartzose, unoxidized-----	7	31
	Till, olive-gray, cohesive, silty, moderately calcareous-----	4	35
	Sand, very coarse to coarse, subangular to subrounded, gravelly-----	4	39
	Till, olive-gray, cohesive, silty, moderately calcareous-----	2	41
	Gravel, fine to medium, subangular, sandy; predominantly shale fragments-----	13	54
	Silt, olive-gray, cohesive, clayey, moderately calcareous-----	4	58
	Till, dark-greenish-gray to olive-gray, very cohesive-----	5	63

	Sand, very fine, angular to subangular, quartzose, oxidized-----	4	24
	Sand, very fine, angular to subangular, quartzose, unoxidized-----	7	31
	Till, olive-gray, silty-----	4	35
	Sand, very coarse to coarse, subangular to subrounded, gravelly-----	4	39
	Till, olive-gray, silty-----	2	41
	Gravel, fine to medium, subangular, sandy; shale fragments predominate-----	13	54
	Silt, olive-gray, moderately calcareous, clayey-----	4	58
	Till, dark-greenish-gray to olive-gray-----	5	63

152-55-27abb

Glacial drift:	Soil, brownish-black, silty-----	1	1
	Silt, pale-yellowish-brown to dark-yellowish- brown, sandy, oxidized-----	5	6
	Sand, fine to medium, subangular to subrounded, oxidized-----	14	20
	Sand, fine to medium, subangular to subrounded, unoxidized-----	11	31
	Silt, olive-gray, sandy-----	11	42

152-55-27ddd

Glacial drift:	Soil, black, silty-----	1	1
	Silt, moderate-yellowish-brown to dark-yellowish- brown, oxidized-----	14	15
	Sand, coarse, moderately poorly sorted, angular to subrounded; shale fragments predominate; unoxidized-----	19	34
	Silt, olive-gray to dark-greenish-gray, sandy---	29	63
	97		

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Roadfill-----	4	4	
Silt, moderate-yellowish-brown, clayey, oxidized-----	4	8	
Clay, moderate-yellowish-brown, silty, oxidized-----	6	14	
Clay, olive-gray, slightly calcareous-----	78	92	
Till, olive-gray, clayey-----	42	13 ⁴	
Till, olive-gray, silty to sandy-----	27	161	
Till, dark-yellowish-brown to brownish-gray, silty to sandy-----	19	180	
Sand, medium-light-gray, fine to very coarse, silty, lignitic-----	6	186	
Silt, pale-brown to dark-reddish-brown-----	4	190	
Till, dark-yellowish-brown, sandy to bouldery, very calcareous-----	8	198	
Gravel, fine to coarse, poorly sorted, sub- angular; driller reports interstratified till-----	9	207	
Till, dark-yellowish-brown, sandy to gravelly, very calcareous-----	18	225	
Till, olive-gray, very bouldery-----	27	252	
Winnipeg Group:			
Clay, very-pale-orange, very calcareous-----	1	253	
Poor samples-----	1	254	

Glacial drift:			
Soil, black, silty-----	2	2	
Silt, yellowish-gray, clayey; light-brown clay laminae; oxidized-----	8	10	
Clay, yellowish-gray, oxidized-----	7	17	
Clay, olive-gray; light-gray, calcareous specks; unoxidized-----	72	89	
Till, olive-gray, very clayey-----	6	95	
Dakota Group:			
Sand, light-gray to medium-light-gray, fine, well-sorted, quartzose-----	20	115	
Silt, olive-gray-----	5	120	
Sand, light-gray to medium-light-gray, medium to coarse, subrounded to rounded; lignitic near base-----	30	150	
Red River Formation (?):			
Poor samples-----	1	151	

Glacial drift:			
Soil, brownish-black, clayey-----	1	1	
Clay, moderate-yellowish-brown to dark-yellow- ish-brown, silty noncalcareous, oxidized---	18	19	
Clay, olive-gray, slightly silty; medium-gray silt laminae; unoxidized; becomes less silty with depth-----	76	95	

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
Till, olive-gray, silty to slightly sandy, very calcareous-----	25	120	
Clay, olive-gray-----	16	136	
Till, olive-gray-----	27	163	
Till, pale-brown to pale-reddish-brown, very sandy, very calcareous-----	3	166	
Silt, moderate-reddish-brown-----	4	170	
Till, moderate-yellowish-brown to pale-red- dish-brown, very sandy; very bouldery from 170 to 181-----	21	191	
Till, olive-gray, sandy, very calcareous-----	4	195	
Gravel, medium to coarse, angular to sub- angular; predominately limestone-----	8	203	
Red River Formation:			
Limestone, bluish-white to pinkish-gray, microcrystalline; bluish-white, very calcareous clay-----	5	208	

Glacial drift:			
Soil, black, silty-----	2	2	
Silt, moderate-yellowish-brown to pale-olive- gray, clayey, noncalcareous, oxidized-----	14	16	
Silt, olive-gray, clayey, unoxidized-----	50	66	
Till, olive-gray to dark-greenish-gray, silty	39	105	
Gravel, fine to coarse, poorly sorted, angular to subrounded-----	8	113	
Till, olive-gray, silty to gravelly, very calcareous-----	9	122	
Till, olive-gray, very silty to sandy; sand below 126 feet flowed 24 gallons per minute-----	4	126	

Glacial drift:			
Soil, brownish-black, clayey-----	3	3	
Clay, yellowish-gray, silty, oxidized-----	7	10	
Sand, fine to medium, moderately sorted, sub- angular to subrounded, quartzose, oxidized-----	6	16	
Clay, light-olive-gray, slightly calcareous, unoxidized-----	15	31	
Till, light-olive-gray, silty-----	40	71	
Sand, fine to medium, moderately sorted, sub- angular to subrounded, quartzose-----	10	81	
Clay, olive-gray, very silty-----	18	99	
Sand, fine to medium, well-sorted, subangular to subrounded, quartzose-----	7	106	
Till, olive-gray, very silty; interstratified fine to medium, poorly sorted sand; well flowed 20 gallons per minute from sand at 116 feet-----	10	116	

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
	Soil, black, silty-----	1	1
	Clay, pale-olive-gray to moderate-yellowish-brown, oxidized-----	11	12
	Till, olive-gray to dark-greenish-gray, very silty to sandy, unoxidized-----	59	71

	Soil, brownish-black, silty-----	1	1
	Silt; poor samples-----	2	3
	Sand, coarse, poorly sorted, angular to sub- rounded, oxidized-----	6	9
	Sand, coarse, poorly sorted, angular to sub- rounded, unoxidized-----	30	39
	Till, olive-gray to dark-greenish-gray-----	14	53

Glacial drift:			
	Soil, brownish-black, sandy-----	1	1
	Sand, fine to coarse, poorly sorted, sub- angular to subrounded, quartzose, gravelly--	4	5
	Sand, medium to coarse, moderately sorted, quartzose, oxidized; sand becomes finer near base-----	9	14
	Silt, medium-gray to dark-gray, clayey, unoxidized-----	3	17

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift--Continued:			
Sand, fine to medium, well-sorted, subrounded to rounded, quartzose, unoxidized---	16	33	
Sand, fine to medium, moderately sorted, angular to subrounded, quartzose; very clayey from 51 to 53-----	20	53	
Silt, olive-gray, very clayey, moderately cohesive; scattered light-gray silt laminae-----	33	86	
Till, olive-gray, clayey-----	6	92	
Till, brownish-gray, silty to sandy-----	10	102	
Till, olive-gray, clayey to silty-----	78	180	
Till, olive-gray, silty to sandy-----	17	197	
Till, olive-gray, clayey-----	21	218	
Till, olive-gray, silty to sandy, slightly calcareous-----	17	235	
Till, olive-gray, clayey, cohesive-----	14	249	
Greenhorn(?) Formation:			
Shale, olive-black, noncalcareous; scattered medium-gray, noncalcareous, silt laminae----	11	260	

Glacial drift:			
Soil, grayish-black, sandy-----	1	1	
Sand, grayish-orange, medium, well-sorted, subangular to subrounded, oxidized-----	17	18	
Sand, olive-gray, medium to coarse, moderately well-sorted, subangular to subrounded, unoxidized-----	11	29	
Clay, light-olive-gray, slightly silty, noncalcareous-----	9	38	
Till, olive-gray, sandy-----	21	59	
Sand, coarse, poorly sorted, subangular to subrounded, silty-----	6	65	
Till, olive-gray, clayey-----	54	119	
Till, olive-gray, sandy-----	32	151	
Sand, medium to coarse, poorly sorted, subangular to subrounded, gravelly-----	5	156	
Till, olive-gray, sandy-----	6	162	
Sand, medium to coarse, moderately well-sorted, subangular to subrounded; minor amounts of silt and clay-----	28	190	
Carlile Formation:			
Shale, olive-black, moderately fissile, noncalcareous; difficult drilling between 210 and 214-----	30	220	

<u>Geologic source</u>	<u>Material</u>	<u>Thickness</u> (feet)	<u>Depth</u> (feet)
Glacial drift:			
Soil, dark-brown, sandy-----	1	1	
Sand, dusky-brown, fine to medium, well-sorted, subrounded, quartzose, oxidized-----	9	10	
Till, olive-gray, clayey, very calcareous, unoxidized-----	71	81	
Sand, medium to coarse, poorly sorted-----	1	82	
Till, olive-gray, clayey-----	153	235	
Sand, medium to coarse, moderately well- sorted, subangular to subrounded, quartzose-----	9	244	
Till, olive-gray, sandy to gravelly-----	45	289	
Till, olive-gray, clayey-----	9	298	
Greenhorn Formation:			
Clay, olive-gray, silty, very calcareous; light-gray silt laminae-----	17	315	

Glacial drift:			
Soil, brownish-black, silty-----	1	1	
Silt, yellowish-brown, clayey-----	2	3	
Sand, very coarse, poorly sorted, angular to rounded, gravelly, oxidized-----	7	10	
Sand, coarse, poorly sorted, angular to sub- rounded, oxidized-----	12	22	
Till, olive-gray to dark-greenish-gray, silty--	28	50	
Gravel, poorly sorted, angular to rounded-----	3	53	
Silt, olive-gray to dark-greenish-gray, sandy--	6	59	
Till, olive-gray to dark-greenish-gray, silty; boulders from 124 to 126-----	96	155	
Sand, very coarse, poorly sorted, angular to subrounded, gravelly-----	2	157	
Till, olive-gray, very silty-----	19	166	
Carlile Formation:			
Shale, olive-gray, hard; light-gray silt laminae; noncalcareous-----	23	189	

Glacial drift:			
Soil, brownish-black, sandy-----	1	1	
Sand, medium to coarse, moderately well- sorted, subangular to subrounded, oxidized; very gravelly from 12 to 17-----	17	18	
Sand, medium to coarse, moderately sorted, subangular, unoxidized-----	15	33	
Clay, light-olive-gray, very silty-----	7	40

This is one of a series of county reports published cooperatively by the North Dakota Geological Survey and the North Dakota State Water Commission. The reports are in three parts: Part I describes the geology, Part II presents ground water basic data, and Part III describes the ground water resources. Parts I and III will be published later and will be distributed as soon as possible.
