GROUND-WATER BASIC DATA FOR MORTON COUNTY, NORTH DAKOTA

By

D. J. Ackerman

INTRODUCTION

The ground-water investigation in Morton County, North Dakota (fig. 1), was made cooperatively by the U.S. Geological Survey (USGS), North Dakota State Water Commission (NDSWC), North Dakota Geological Survey (NDGS), and the Morton County Water Management District. The results of the investigation are published in three separate parts. Part 1 is an interpretive report describing the geology of the county; part 2 is a compilation of the ground-water basic data; and part 3 is an interpretive report describing the ground-water resources. Part 2 (this report) makes available hydrologic and geologic data collected during the investigation and is a reference for the other reports.

The purpose of the investigation was to determine the quantity and quality of ground water available for municipal, domestic, livestock, industrial, and irrigation uses. Specifically, the objectives were: (1) determine the location, extent, and nature of the major aquifers; (2) evaluate the occurrence and movement of ground water, including the sources of recharge and discharge; (3) estimate the quantities of water stored in the aquifers; (4) estimate the potential yields to wells tapping the aquifers; and (5) determine the chemical quality of the ground water.

Most data in this report were collected between 1972 and 1975. All data-collection points are shown on plate 1 (in pocket). The data consist of the following: (1) Geologic and hydrologic data for 1,209 wells, test holes, and springs; (2) water-level measurements for 148 observation wells; (3) lithologic and geophysical logs for 247 test holes and wells; (4) chemical analyses of 353 water samples; and (5) analyses of physical properties of 42 core samples. These data are useful for estimating geologic and ground-water conditions when considering the construction of a new well. Use of these data as a guide to conditions at a place some distance from the data-collection point should be done with caution due to the discontinuous nature of the water-bearing rocks and irregular nature of water chemistry in some aquifers.

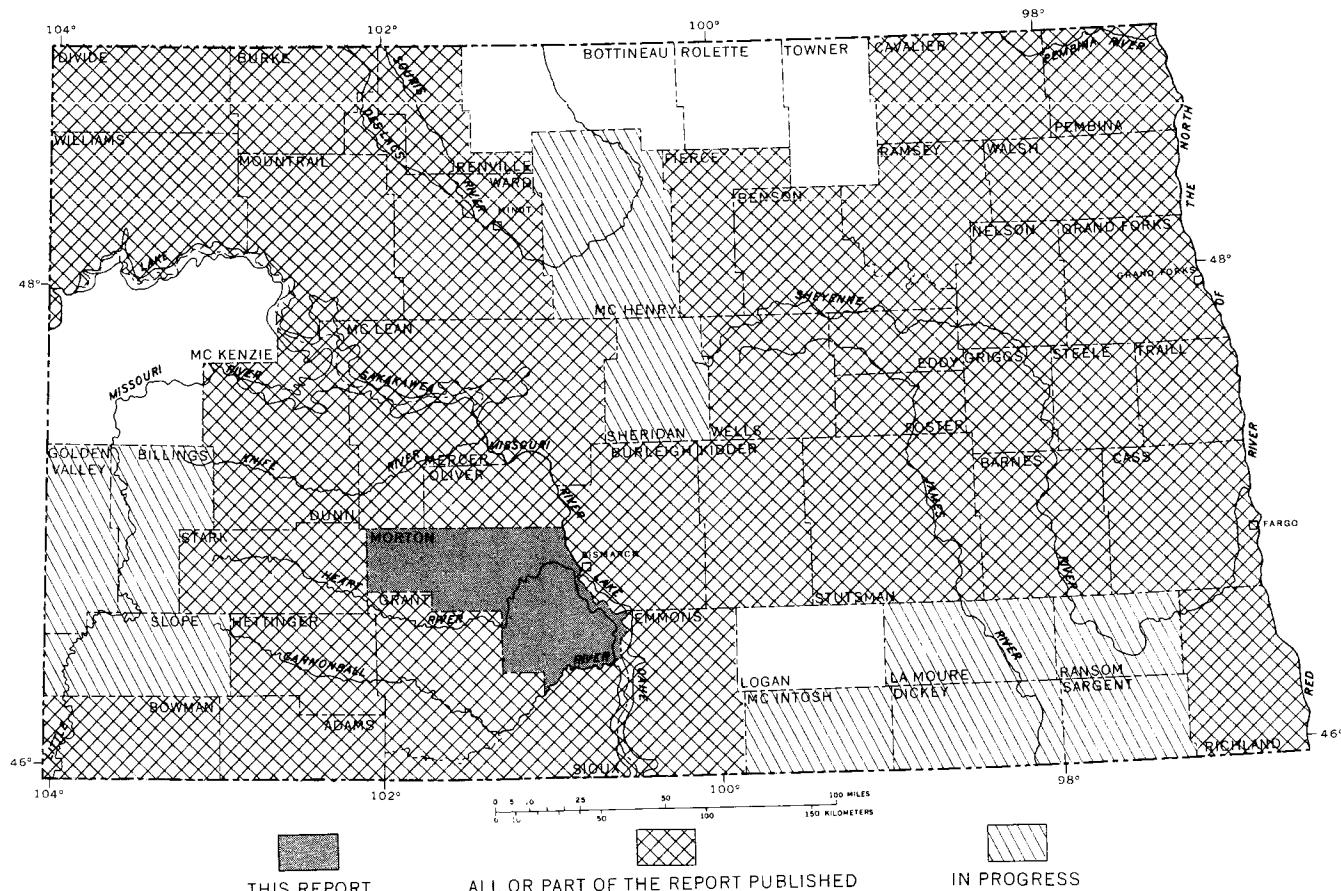

FIGURE 1.—County ground-water studies in North Dakota.

The stratigraphic nomenclature used in this report is that of the North Dakota Geological Survey (Scott, 1972) and does not necessarily follow the usage of the U.S. Geological Survey.

Temperatures given in the tables are expressed in degrees Celsius (Centigrade). Degrees Celsius ( $^{\circ}\text{C}$ ) and the equivalent temperature in degrees Fahrenheit ( $^{\circ}\text{F}$ ) are given in the following table. Temperatures are reported to nearest 0.5  $^{\circ}\text{C}$ .

Degrees Celsius ( $^{\circ}\text{C}$ ) <sup>1</sup>	Degrees Fahrenheit ( $^{\circ}\text{F}$ )	Degrees Celsius ( $^{\circ}\text{C}$ )	Degrees Fahrenheit ( $^{\circ}\text{F}$ )	Degrees Celsius ( $^{\circ}\text{C}$ )	Degrees Fahrenheit ( $^{\circ}\text{F}$ )
0.0	32	10.0	50	20.0	68

9.0	48	19.0	66	29.0	84
9.5	49	19.5	67	29.5	85

$^{\circ}\text{C} = 5/9 (\text{ }^{\circ}\text{F}-32)$  or  $\text{ }^{\circ}\text{F} = 9/5 (\text{ }^{\circ}\text{C}+32)$ .

The following table may be used to convert English units used in this report to International System (SI) units.

Multiply English units	By	To obtain SI units
Inches (in)	25.4	millimeters (mm)
	.0254	meters (m)
Feet (ft)	.3048	meters (m)
Acres	4,047	square meters ( $\text{m}^2$ )
	.4047	hectares (ha)

#### LOCATION-NUMBERING SYSTEM

The data-collection sites in the tables are numbered according to a system of land survey in use by the U.S. Bureau of Land Management. The system is illustrated in figure 2. The first numeral denotes the township north of a base line, the second numeral denotes the range west of the

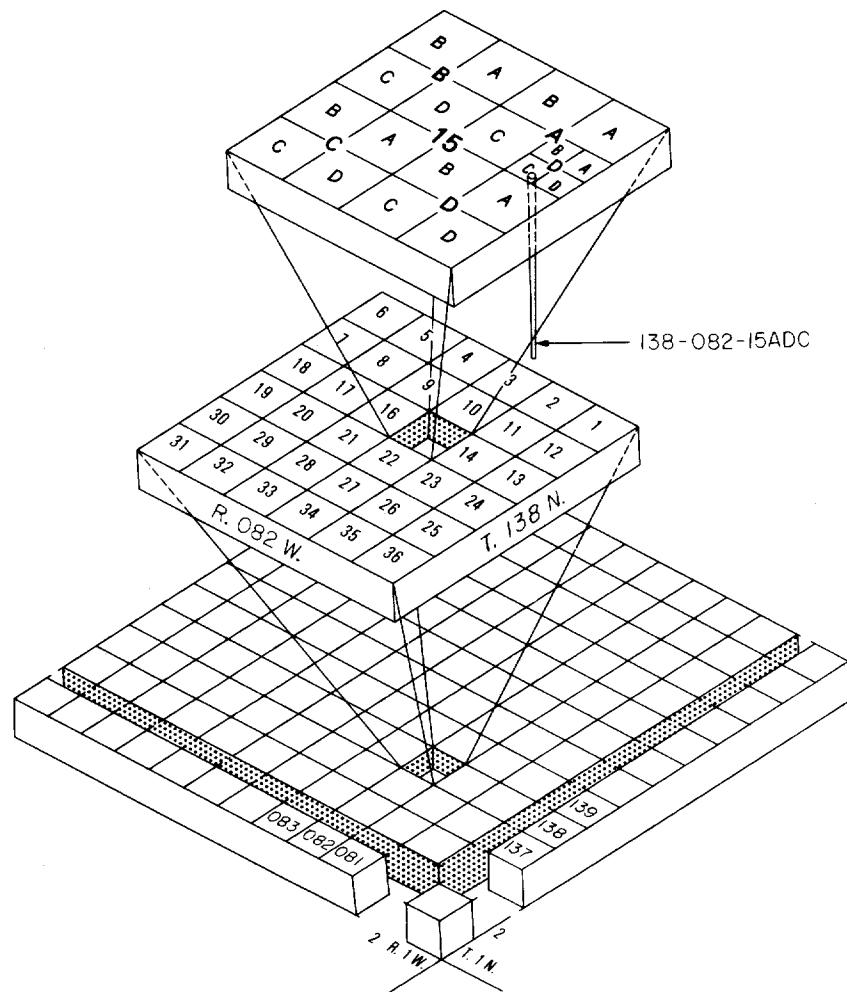

FIGURE 2.—System of numbering data-collection sites

fifth principal meridian, and the third numeral denotes the section in which the site is located. The letters A, B, C, and D designate, respectively, the northeast, northwest, southwest, and southeast quarter section, quarter-quarter section, and quarter-quarter-quarter section (10-acre or 4-ha tract). For example, well 138-082-15ADC is in the SW $\frac{1}{4}$ SE $\frac{1}{4}$ NE $\frac{1}{4}$  sec. 15, T. 138 N., R. 082 W. Consecutive terminal numerals are added if more than one well, test hole, or spring is recorded within a 10-acre tract.

#### ACKNOWLEDGMENTS

The collection of data for this report was made possible by the cooperation of residents and officials of Morton County, who gave information on wells, permitted measurements to be made, and allowed samples to be taken. Recognition is due the following personnel of the North Dakota State Water Commission: L. L. Froelich, C. E. Naplin, L. D. Smith, G. L. Sunderland, and L. M. Knutson for drilling and logging test holes and for contributions to the understanding of the stratigraphy; G. O. Muri for chemical analyses of water samples; R. W. Schmid for hydrologic testing; and M. O. Lindvig for scheduling of drilling activities. Recognition is also due C. G. Carlson of the North Dakota Geological Survey for his contributions to the understanding of the geology of the county. Thanks are due to the many local water-well contractors for furnishing drillers' logs.

#### EXPLANATION OF TABLES AND METHODS OF DATA COLLECTION

##### Records of Wells, Test Holes, and Springs

Records of wells, test holes, and springs are given in table 1. Most data concerning privately owned wells and springs were obtained from personal interviews, although some data were obtained from well-completion records filed with the North Dakota State Water Commission. Water samples for the field determination of specific conductance and temperature were secured using the existing pumps from privately owned wells. The laboratory value of specific conductance is given for samples submitted for analysis.

Most test holes were converted to observation wells for periodic water-level measurements and water-quality sampling. At some sites, more than one hole was drilled and observation wells were installed in different

aquifers or at different intervals within the same aquifer. Observation wells installed in glacial-drift or alluvial aquifers were constructed of 1½-inch (32-mm) diameter plastic casing with 3- or 6-foot (1- or 2-m) length screens. Aquifer material was collapsed around the screens by blowing compressed air into the wells. Observation wells in bedrock aquifers were constructed of 1½-inch (32-mm) diameter plastic casing with screens 6 feet (12-m) long or 2-inch (51-mm) diameter steel casing with screens 6, 12, or 18 feet (2, 4, or 6 m) long. Coarse sand or gravel was placed around the screens of the 1½-inch (32-mm) bedrock wells. Rubber shale catchers were placed immediately above and, again, 20 to 40 feet (6.1 to 12.2 m) above the screen of the 2-inch (51-mm) diameter bedrock wells. Observation wells were backwashed either with water, water and detergent, or the deflocculant trisodium phosphate. All observation wells were developed by airlift pumping for a minimum of 6 hours before collection of water samples.

#### Water-Level Measurements in Selected Observation Wells

Table 2 gives monthly or intermittent water levels, in feet below or (+) above land surface, in selected observation wells in major aquifers. Those wells which did not show a rapid recovery following development were not included in table 2. Measurements of water levels were made with a chalked steel tape or, in the case of wells which would flow, a pressure gage. The wells are arranged in the table by location number. Water levels in selected wells will continue to be measured as part of the statewide observation-well network to monitor changes as the ground-water resources of the area are developed.

#### Logs of Wells and Test Holes

Logs collected from water-well drillers or other sources and logs of test holes drilled as part of this project are shown in table 3. Minor changes in word order have been made in some of the drillers' logs. Geophysical logs, which generally are useful for correlation purposes, have been obtained for most test holes drilled during this project and some municipal, public supply, and private wells or test holes. Grain sizes were referenced to the Wentworth (1922) scale and colors were referenced to the Geological Society of America (1963) rock-color chart.

Chemical Analyses of Ground Water

The chemical quality of water from selected wells and springs is given in tables 4 and 5. The analyses in tables 4 and 5 are arranged according to the location number. If more than one analysis exists for a well, the analyses are arranged according to the time of sampling. Analyses in table 4 for which additional trace constituents are given in table 5 are noted. These analyses were made by the USGS laboratory, Salt Lake City, Utah. All other analyses were made by the NDSWC laboratory, Bismarck, N. Dak. The methods of analyses were generally those described by Brown and others (1970).

Water samples for the chemical analyses in tables 4 and 5 were secured using the existing pumps in private wells or by airlift from NDSWC wells. Usually enough water to clear the well column and plumbing was pumped before sampling private wells. NDSWC wells were sampled after development of the well was complete. Samples for constituents that are not stable in solution after sampling were filtered or preserved, or both.

Some terms useful in the interpretation of the data in tables 4 and 5 are defined below.

Chemical quality includes concentration of solutes (any substance dissolved in water) and certain properties or characteristics such as hardness, sodium-adsorption ratio, percent sodium, and specific conductance.

Hardness is the concentration of calcium and magnesium expressed as equivalent calcium carbonate.

Micrograms per liter ( $\mu\text{g/L}$ ,  $\text{UG/L}$ ) is a unit expressing the concentration of a chemical constituent in solution as weight (micrograms) of solute per unit volume (liter) of water.

Milligrams per liter ( $\text{mg/L}$ ,  $\text{MG/L}$ ) is a unit expressing the concentration of a chemical constituent in solution as weight (milligrams) of solute per unit volume (liter) of water. 1 mg/L equals 1,000  $\mu\text{g/L}$ .

Percent sodium (% Na) is the percentage of total cations made up by sodium (concentrations in equivalents per liter).

Sodium-adsorption ratio (SAR) is the expression of relative activity

of sodium ions in exchange reactions with soil. The formula used for the computation of SAR is

$$SAR = \sqrt{\frac{(Na^+)}{\frac{(Ca^{+2}) + (Mg^{+2})}{2}}}$$

where solute concentrations are expressed in milliequivalents per liter.

Specific conductance is a measure of the ability of water to conduct an electrical current and is expressed in micromhos per centimeter ( $\mu\text{mhos}/\text{cm}$ ) at 25°C.

#### Drinking-Water Standards

Drinking-water standards were established for interstate carriers by the U.S. Public Health Service in 1946. These standards were amended in 1956 and in 1962 the standards were again changed and published (U.S. Public Health Service, 1962) in the Federal Register, effective date April 5, 1962. These are generally accepted by the North Dakota State Department of Health as guidelines applicable to public water supplies. These standards are:

*"Drinking water shall not contain impurities in concentrations which may be hazardous to the health of the consumers. It should not be excessively corrosive to the water supply system. Substances used in its treatment shall not remain in the water in concentrations greater than required by good practice. Substances which may have deleterious physiological effect, or for which physiological effects are not known, shall not be introduced into the system in a manner which would permit them to reach the consumer.*

*"The following chemical substances should not be present in a water supply in excess of the listed concentrations where, in the judgment of the Reporting Agency and Certifying Authority, other more suitable supplies are or can be made available.*

<u>Substance</u>	<u>Concentrations in mg/L</u>
Alkyl Benzene Sulfonate (ABS)-----	0.5
Arsenic (As)-----	0.01
Chloride (Cl)-----	250.
Copper (Cu)-----	1.
Carbon Chloroform Extract (CCE)-----	0.2
Cyanide (CN)-----	0.01
Fluoride (F)-----	(See 5.23)
Iron (Fe)-----	0.3
Manganese (Mn)-----	0.05
Nitrate <sup>1</sup> (NO <sub>3</sub> )-----	45.
Phenols-----	0.001
Sulfate (SO <sub>4</sub> )-----	250.
Total Dissolved Solids-----	500.
Zinc (Zn)-----	5.

<sup>1</sup>In areas in which the nitrate content of water is known to be in excess of the listed concentration, the public should be warned of the potential dangers of using the water for infant feeding.

"The presence of the following substances in excess of the concentrations listed shall constitute grounds for rejection of the supply:

<u>Substance</u>	<u>Concentrations in mg/L</u>
Arsenic (As)-----	0.05
Barium (Ba)-----	1.0
Cadmium (Cd)-----	0.01
Chromium (Hexavalent) (Cr <sup>+6</sup> )-----	0.05
Cyanide (CN)-----	0.2
Fluoride (F)-----	(See 5.23)
Lead (Pb)-----	0.05
Selenium (Se)-----	0.01
Silver (Ag)-----	0.05

"5.23 Fluoride.--When fluoride is naturally present in drinking water, the concentration should not average more than the appropriate upper limit shown in the following table. Presence of fluoride in average concentrations greater than two times the optimum values listed shall constitute grounds for rejection of the supply.

"Where fluoridation (supplementation of fluoride in drinking water) is practiced, the average fluoride concentration shall be kept within the upper and lower control limits listed below.

<u>Annual average of maximum daily air temperatures<sup>1</sup></u>	<u>Recommended control limits-- Fluoride concentrations in mg/L</u>		
	<u>Lower</u>	<u>Optimum</u>	<u>Upper</u>
50.0 - 53.7-----	0.9	1.2	1.7
53.8 - 58.3-----	0.8	1.1	1.5
58.4 - 63.8-----	0.8	1.0	1.3
63.9 - 70.6-----	0.7	0.9	1.2
70.7 - 79.2-----	0.7	0.8	1.0
79.3 - 90.5-----	0.6	0.7	0.8

<sup>1</sup>Based on [Fahrenheit] temperature data obtained for a minimum of five years."

### Water-Quality Parameters and Their Practical Significance

The practical significance of several water-quality parameters is given below. These explanations were compiled from Durfor and Becker (1964), Environmental Protection Agency (1973), and Hem (1970).

#### Solutes

*Bicarbonate ( $HCO_3$ ) and Carbonate ( $CO_3$ )* can contribute to scale in hot water heaters and cooking utensils. Relatively high concentrations may have an unpleasant taste.

*Boron (B)* is an essential element for the growth of plants. However, concentrations of more than 3.0 mg/L are of doubtful suitability for tolerant crops.

*Calcium (Ca) and Magnesium (Mg)* cause water hardness, and with bicarbonate, carbonate, sulfate, and silica can form scale in hot water heaters and cooking utensils. See *Hardness*.

*Chloride (Cl)* in excess of about 100 mg/L imparts a salty taste.

*Fluoride (F)* may have a helpful effect on the structure and resistance to decay of children's teeth. The optimum concentration of fluoride in water depends on the climate of the area. This is because the amount of water drank by children (and as a result the amount of fluoride) is related to the air temperature. See drinking-water standards section.

*Iron (Fe)* in excess of 300  $\mu\text{g}/\text{L}$  stains plumbing fixtures, laundry, and cooking utensils, and may affect the taste of food and drinks.

*Manganese (Mn)* in excess of 500  $\mu\text{g}/\text{L}$  causes undesirable tastes, spotting of laundered clothes, and an accumulation of deposits in plumbing systems.

*Nitrate ( $NO_3$ )*, reported as *Nitrogen (N)*, in excess of 10 mg/L may cause methemoglobinemia in infants and may impart a bitter taste. High nitrate concentrations in water from wells are often the result of inadequate protection from barnyard drainage and septic tanks.

*pH* is the negative logarithm of the hydrogen-ion concentration in moles per liter. pH indicates the degree of acidity or alkalinity of water. pH values progressively lower than 7.0 indicate increasing acidity, values progressively higher than 7.0 indicate increasing alkalinity, and a pH of 7.0 indicates that the water is neither acid nor alkaline.

*Silica* ( $SiO_2$ ) with calcium and magnesium may form scale in water heaters and cooking utensils.

*Sodium* (Na) intake restrictions are recommended by physicians for a significant portion of the population. The presence of relatively high concentrations of sodium in irrigation water produces adverse effects. See *Percent Sodium and Sodium-Adsorption Ratio*.

*Sulfate* ( $SO_4$ ) in excess of 750 mg/L may have a laxative effect. Less than 600 mg/L does not usually cause a laxative effect. If a person is not used to these waters or if magnesium concentrations are higher than 200 mg/L, laxative effects will occur at lower concentrations.

#### **Properties and Characteristics of Water**

*Hardness* of water is related to the requirement for soap. Hard water requires more soap and other detergents in cleaning processes. Hard water will also leave scale deposits when heated.

*Percent Sodium* (% Na) and *Sodium-Adsorption Ratio* (SAR) are characteristics used to judge the suitability of water for irrigation purposes. The greater the value the greater the hazard for irrigation purposes.

*Specific Conductance* is a measure of the ability of water to conduct electricity. As the concentration of solutes such as sodium, calcium, chloride, sulfate, etc., increases in water, the specific conductance increases. Multiplying specific conductance by 0.55 to 0.75 will give an estimate of the dissolved solids. The relation is not constant and may range from about 0.54 to 0.96 depending on the chemical composition of water.

*Temperature* may influence the taste or odor of water. As temperature increases, taste and odor become more noticeable. The temperature of water is an important factor in evaluating usability of water as an industrial coolant.

#### **Physical Properties of Core Samples**

Various physical properties of cores from selected test holes are given in table 6. Cores from NDSWC test holes were obtained with a Christensen core barrel. Cores from USGS test holes were taken from fresh outcrops of bedrock with hand-driven 1½-inch (32-mm) metal tubes.

Analyses to determine hydraulic conductivity and porosity were made by Core Laboratories, Inc., Williston, N. Dak., and particle-size analyses were made by the USGS sediment laboratory, Worland, Wyo., for test holes 137-086-03AAD1 and 139-088-34BCC1. All other analyses were made by the USGS hydrologic laboratory, Denver, Colo. The statistical characteristics given were computed by the Denver hydrologic laboratory according to formulas given in Pettijohn (1949). Data are arranged by location number and depth within the test hole.

TABLE 2.--Water-level measurements in selected observation wells

## EXPLANATION

Water levels shown have been adjusted to feet below or (+) above land surface  
 MP, measuring point      lsd, land surface datum      msl, mean sea level

Depth to water, in feet below or (+) above land surface

---

133-082-05DBA NDSWC 4569 Drilled depth 240 ft, cased to 168 ft with 1½-inch plastic pipe, No. 18-slot screen set 168-174 ft below lsd; MP top of casing 1.5 ft above lsd. Lsd 1742 ft above msl. Aquifer: Buried sand and gravel of Quaternary age.

---

TABLE 3.--Logs of wells and test holes

## EXPLANATION

Electric logs are uncalibrated except where designated. Depths shown are in feet below land surface.

Potential given in millivolts (MV). Natural-gamma logs (T.C. 4) (Time Constant 4).

Resistance in ohms. Bulk density in grams/cc.

<u>Geologic source</u>	<u>Material</u>	<u>Thickness (feet)</u>	<u>Depth (feet)</u>
<b>Glacial drift:</b>			
Topsoil-----		1	1
Clay, light- to moderate-olive-brown, silty, calcareous, cohesive, solid, oxidized-----		29	30
Silt, olive-black, clayey, calcareous; a few snail shells; with abundant detrital lignite-----		11	41
Sand, fine to coarse, subrounded; predominantly quartz; with detrital lignite and shale-----		20	61
Silt, light-olive-gray, slightly calcareous, soft, cohesive-----		8	69
Sand, fine to very coarse, gravelly; predominantly quartz; with silt stringers; abundant granules and pebbles of limestone-----		21	90
Silt, olive-gray, clayey, sandstone, and olive-black very fine slightly calcareous to calcareous soft solid lignite; some laminations; lenses of detrital lignite from 235 to 255 feet-----		165	255
Silt, gravelly; detrital lignite with shale and sandstone gravel-----		45	300
<b>Hell Creek Formation:</b>			
Shale and sandstone, brown, very hard-----		3	303
Sandstone, grayish-blue-green, friable, very hard-----		17	320

<u>Geologic source</u>	<u>Material</u>	<u>Thickness (feet)</u>	<u>Depth (feet)</u>
<b>Glacial drift:</b>			
	Clay, dark-yellowish-brown, very silty, highly calcareous, cohesive, moderately plastic; with medium-dark-gray mottling; a few pebbles (glacial lake sediment)-----	24	24
	Clay, moderate-yellowish-brown, moderately sandy, silty, moderately cohesive, plastic, oxidized (glacial lake sediment)-----	30	54
	Clay, olive-gray, very silty, slightly sandy, highly calcareous, moderately cohesive, sticky; with some dark-yellowish-brown mottling; occasional thin sand lenses and angular lignite chips (glacial lake sediment)-----	70	124
	Clay, olive-gray, very silty, highly calcareous, cohesive, plastic, sticky; with light-olive-gray laminae; numerous sandy silt lenses throughout section (glacial lake sediment)-----	144	268
	Silt, medium-gray, very sandy, soft, slightly plastic; sand lenses; sand from 280 to 288 feet; washing out and caving in; losing circulation; drills easy-----	20	288
<b>Hell Creek Formation:</b>			
	Sandstone, greenish-gray, silty, micaceous, subangular, consolidated; some brownish-gray mottling-----	4	292
	Siltstone, medium-dark-gray to dark-greenish-gray, very sandy, non-calcareous, moderately indurated; some brownish-gray mottling and dark-brown carbonaceous shale-----	32	324
	Sandstone, greenish-gray to light-bluish-gray, very fine to fine, subangular, micaceous, lignitic, limey, friable, consolidated; with light-gray mottling; some thin siltstone bedding-----	76	400
	Siltstone, medium-gray to medium-dark-gray, slightly sandy, non-calcareous, moderately indurated; some bentonite-----	25	425
<b>Fox Hills Formation:</b>			
	Sandstone, medium-bluish-gray to greenish-gray, very fine to medium, subangular, micaceous; some light-bluish-gray specks; mostly very fine to fine; occasional cemented concretions; some light-brownish-gray siltstone bedding; about 95 percent quartz and 5 percent dark minerals; fossiliferous shell fragments-----	69	494

	Sandstone, dark-yellowish-brown, very fine to fine, subangular, well-oxidized-----	5	35
	Claystone, greenish-gray, silty, calcareous, slightly bentonitic, moderately indurated-----	7	42
	Sandstone, bluish-gray, very fine to fine, slightly clayey, subangular, limey; fossiliferous (?)-----	4	46
	Claystone, medium-gray, very sandy, slightly calcareous, moderately indurated; with brownish-gray mottling-----	14	60

Altitude: 2160 feet

<u>Geologic source</u>	<u>Material</u>	<u>Thickness (feet)</u>	<u>Depth (feet)</u>
Glacial drift:			
	Clay, dark-yellow-brown, very sandy, silty, slightly cohesive, oxidized-----	2	2
Sentinel Butte Formation:			
	Sandstone, yellow-brown, fine, subangular to subrounded, clean, quartzose, semiconsolidated, oxidized-----	18	20
	Claystone, yellow-brown, very sandy, silty, slightly indurated, oxidized-----	14	34
	Lignite, black, very hard, brittle-----	4	38
Tongue River Formation:			
	Siltstone, greenish-gray, siliceous, noncalcareous, indurated-----	8	46
	Siltstone, medium-light-gray to medium-gray, clayey, slightly sandy, noncalcareous, moderately indurated; a few light-brownish-gray shale layers-----	46	92
	Lignite, black, hard, brittle; carboniferous shale partings-----	2	94
	Claystone, medium-gray, sandy, silty, noncalcareous, moderately indurated; a few yellowish-gray limestone concretions-----	36	130
	Lignite, brownish-black to black, shaly, moderately soft, brittle-----	4	134
	Claystone, medium-gray, silty, slightly calcareous, moderately indurated; a few thin dark-brown carboniferous shale layers and lignite stringers; sandy in places-----	10	144
	Sandstone, medium-light-gray, very fine to fine, silty, micaceous, limey, well-cemented, consolidated-----	12	156
	Siltstone, light-gray, clayey, highly calcareous, limey, slightly indurated-----	8	164
	Lignite, black, hard, brittle; shale partings-----	3	167
	Claystone, brownish-gray, silty, moderately indurated; occasional limestone and sandstone concretions-----	35	202
	Sandstone, light-bluish-gray, very fine to fine, clayey, calcareous, slightly cemented-----	5	207
	Lignite, black to brownish-black, brittle; a few thin carboniferous shale partings-----	9	216
	Shale, dark-brown to brownish-gray, silty, calcareous, moderately indurated-----	4	220
	Lignite, black, brittle-----	3	223
	Shale, brownish-gray, moderately sandy, carbonaceous, moderately indurated-----	30	253
