## **INTRODUCTION**

The West Fargo aquifer system (WFAS) is located predominantly in eastern Cass County and northeast Richland County. The WFAS is comprised of three aquifers that underlie an area of 10 square miles or more, and numerous, smaller subaquifers. The three aquifers of 10 square miles or more are called the West Fargo North aquifer, the West Fargo South aquifer, and the Horace aquifer. These aquifers are indirectly connected, as are many of the numerous, smaller subaquifers. The nature of the indirect connections between the aquifers and the subaquifers vary, both in nature and in degree. The total area underlain by all of the aquifers or subaquifers in the WFAS is estimated to be about 90 square miles.

Across the river in Minnesota there are additional small subaquifers, and the Buffalo aquifer. In order to ascertain if there are any connections between the WFAS and the aquifers and subaquifers in Minnesota, the study area was expanded to include part of Minnesota. Thus the study area incorporates several townships that lie partly or entirely in Minnesota. The total study area (see Figure 1) incorporates about 1,550 square miles.

The WFAS has been used as a source of water for over 100 years, dating back to the late 1800's. The utilization of the WFAS as a source of water has increased over this same time period, and as a result, the water levels in all known portions the WFAS have continued to go down in elevation. Concern over the long-term viability of the WFAS

**Figure 1. Location diagram of the study area.**

led to the Southeast Cass Water Resource District's sponsorship of this study of the West Fargo aquifer system.

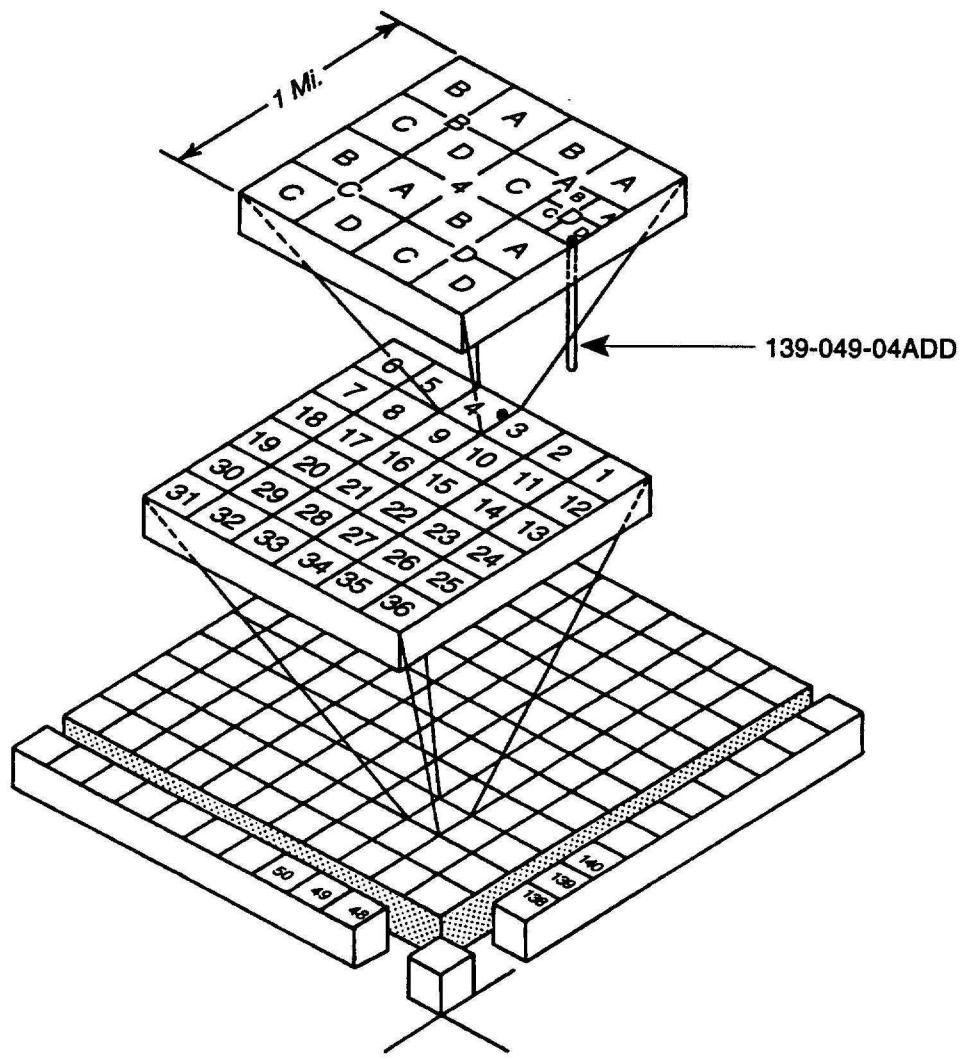

The study is divided into two parts. Part I is a compilation of the geologic and hydrologic data collected during this and previous investigations, as well as data that was not associated with any previous study. Part II is a report that discusses the ground-water resources of the study area.

### **PURPOSE**

The purpose of this investigation was to define the nature of the ground-water resources in the vicinity of eastern Cass County, and northeastern Richland County.

### **LOCATION NUMBERING SYSTEM**

The location-numbering system used in this report (fig. 2) is based on the Federal system of rectangular surveys of the public lands. The first numeral denotes the township, the second denotes the range, and the third denotes the section in which the well or test hole is located. The letters A, B, C, and D designate, respectively, the northeast, northwest, southwest, and southeast quarter section, quarter-quarter section, and quarter-quarter-quarter section (10 acre or 4 hectare tract); thus, well 139-049-04ADD would be located in the

**Figure 2.** Location-numbering system.

**SE1/4 of the SE1/4 of the NE1/4 of Section 4, Township 139 North, Range 49 West.** Consecutive terminal numbers are added if more than one well or test hole is recorded within a 10-acre (4-ha) tract. Thus 139-049-04ADD3 would be the third location in the 10-acre area described by 139-049-04ADD.

In this study each 10-acre area sometimes was further divided into 2.5, 0.625, and 0.15625 acre areas in the same manner described above. Thus, well 139-47-08BACADB is located in the NW1/4 of the SE1/4 of the NE 1/4 of the SW1/4 of the NE1/4 of the NW1/4 of Section 8, Township 139 North, Range 47 West.

#### **ACKNOWLEDGEMENTS**

Local sponsorship of this study was provided by the Southeast Cass Water Resource District. Additionally, data pertaining to the water resources of the area have been gathered from numerous reports mentioned in the references, and from Cliff McLain (city of Moorhead), Bob Welton (city of Fargo), Sean Hunt (Minnesota DNR), Ken Harris & Tim Wahl (Minnesota Geological Survey), Pat McCollum (Cass Rural Water Users, Inc.), Arlen Kotta (city of Comstock), and Scott Lofgren (city of Glyndon). A special thanks to Florenz Bjorson, former mayor of West Fargo, who was part of many early discussions that led to this study.

**EXPLANATION OF TABLES  
AND METHODS OF DATA COLLECTION**

The data in this report are listed in tables 1-7. The data consist of the following: 1) an inventory of selected locations that have wells, piezometers, and test holes, with associated lithologic logs where they are available; 2) water-levels in selected wells and piezometers (up to 1996); 3) chemical analyses of ground water samples (up to 1996); 4) stable isotopic analyses of ground water samples (up to 1996); 5) historic water use (up to 1995); 6) a list of duplicate names and locations of wells; and 7) a list of community water supplies.

Depths, water quality, lithologies, and water levels of wells and test holes tapping the different aquifers can be determined from the tables. However, use of the data as a guide to conditions at different sites should be made with caution because of the lenticular character of the water-bearing materials and varying water quality in some aquifers. Some of the data listed in this publication has been presented in other reports. Because the data is distributed in so many other reports (about 40 to 50 of the reports listed in "Selected References"), this report makes an effort to list all of the previously reported data. Every effort has been made to amalgamate the data so that all data associated with one physical well is listed under one well descriptor.

Most of the locations associated with the data presented in these tables are shown on the map of the study area presented in Plate 1 found in the back of each volume of the data report.

#### Lithologic Logs of Wells, Piezometers, and Test Holes

Lithologic logs collected from water-well contractors and other sources and logs of test holes drilled as part of this investigation are included in Table 1. Minor changes in word order have been made on some of the contractor's logs, and logs of some of the test holes drilled during this and prior investigations. Geophysical logs are available for some test holes. These logs are useful for geologic correlation purposes. The geophysical logs are not published in this report but are available for inspection at the North Dakota State Water Commission office in Bismarck, ND. Grain-size determinations refer to the Wentworth (1922) size scale.

SWC observation wells constructed prior to this study were completed with 1 1/4" or 2" diameter ABS (acrylonitrile-Butadiene-Styrene) or PVC (polyvinyl chloride) pipe. The screens in these wells were generally 3 to 10 feet in length and either plastic, galvanized, or stainless steel with an attached check valve joined to the bottom of the pipe. The screens were most commonly 0.018 or 0.012 inch slot size. The components of an observation well were assembled on the ground at the drill site and then placed into the drill hole. The screen was set at the desired depth, the well back-flushed with clear water to clean the aquifer material and bore hole of drilling fluid, and

compressed air pumped into the well to collapse the formation around the screen. The annulus was filled to ground level with drill cuttings. Each new observation well was pumped for several hours to assure a good hydrologic connection between the well and the aquifer. Pumping was accomplished with an airline connected to a small, trailer-mounted air compressor driven by a gasoline engine.

Piezometers were constructed for this study. Construction of the piezometers involved the drilling of a deep test hole to evaluate the lithology to determine the number of piezometers to be installed at a particular site. This deep test hole (in most instances) also served as the hole for the deep piezometer, if the deepest desired screened interval was close to the bottom of the hole. First, the appropriate length of casing and screen were placed into the test hole. Silica sand was then placed around the screen using a tremie pipe with the lower end located a couple of feet above the top of the screen. After the silica sand was installed around the screen the lower end of the tremie pipe was lifted so that the bottom of the tremie pipe was a few feet above the top of the sand pack. Neat cement grout or high-solids bentonite grout was then pumped down the tremie pipe and upward in the annular space. This process continued until the grout filled the entire annulus up to land surface. If the grout settled, additional grout was poured or pumped down the hole until the annular space was filled to land surface.

A day or two passed to allow the grout to "set", and then the piezometers were slugged with a small quantity of fresh water and

pumped with air for development. Each new piezometer was pumped for several hours to assure a good hydrologic connection between the piezometer and the aquifer. Subsequent piezometers, if necessary, were completed at each site by moving the drilling rig ahead 10 to 20 feet, drilling the next hole, and repeating the above described process.

#### Water Levels in Selected Wells and Piezometers

Table 2 lists the monthly, quarterly, and intermittently measured water levels in selected wells and piezometers, in feet below or above land surface and in elevations. The reference datum for land-surface elevation is the National Geodetic Vertical Datum (NGVD). The elevation of the land surface and/or measuring points at most sites in the database have been determined through the use of the U. S. Geological Survey 7 1/2 minute quadrangle (topographic) maps. The sites were located on the topographic map, and the elevation determined from the map. In most instances this was done in the field, and in some instances this was accomplished in an office environment. The sites determined in this fashion generally are determined to the nearest foot. Most of the observation wells and piezometers that have water level measurements associated with them have had the elevation more accurately determined through the use of differential leveling. The sites determined in this fashion are generally surveyed to the nearest tenth or hundredth of a foot.

## Chemical Analyses of Ground Water

The analyses of the chemical composition and physical properties of water are reported in the Table of Chemical Analyses (Table 3). Most of these chemical analyses were done in the SWC chemical laboratory. The SWC chemical analyses were conducted on water samples collected from selected production wells, observation wells, and piezometers. The water sampling procedure involved the collection of 250 or 500 milliliters (ml) of raw water, filtered water, and filtered and acidified (nitric acid) water. Field measurements of specific conductance and water temperature were also made. Water temperature was, however, measured at land surface and does not represent an in-situ temperature. The pH was measured in the lab. Water samples were collected from domestic, industrial, and city supply wells by using the existing pumps. SWC observation wells and piezometers were sampled using several methods: these methods include bladder, gas squeeze, and peristaltic pumps, as well as airlift, and bailing procedures.

Airlift sampling was accomplished with a small diameter rubber hose attached to a portable air compressor. Sampling with a bailer involved the removal of at least two casing volumes of water by airlift and/or bailing techniques to introduce formation water into the well. After evacuating at least two casing volumes of water, a variable-capacity, point-source, bailer (pvc material) was lowered to just above the top of the well screen, except when the water level was close to the screened interval, in which case the bailer was extended into the

screened interval. Bailing continued until enough water was secured for the sample.

### Stable Isotope Analyses of Ground Water

Samples from selected wells were analyzed for the stable isotopes  $^{18}\text{O}$  (oxygen-18) and  $^2\text{H}$  (deuterium). The results are listed in Table 4. The samples were filtered with a 0.45 micron filter and collected in 40ml bottles that were sealed with Teflon tape. No preservatives were used. The bottles were completely filled with no air headspace. The samples were refrigerated and kept out of direct sunlight.

### Water Use

Historic water use in the study area dates back to the late 1800's; however, the first documented water use dates back to 1903. Documented water use records have been kept and/or reported by a number of different entities over the last 94 years. The result is a patchwork of water use records involving different time periods, with different categories, and different groupings in the amalgamation of reported water use. The water use tables (Tables 5A to 5I) make an effort to capture the recorded water use in as specific a manner as is possible, given the nature of the water use records.

In 1965 the SWC began requiring water use reports for all North Dakota water permit holders. The reporting method was self-reporting on the part of the permit holder in response to a mailing. In 1977 a cooperative effort between the U. S. Geological Survey (USGS) and the SWC was developed for the purpose of gathering more accurate water use data. From 1978 to 1982 the accuracy and the rate of reporting water use records steadily improved. Since 1983 the statewide record is generally about 94% complete, and reasonably accurate, depending on the permit holder.

In 1938 Minnesota began to collect water use data from some large permit holders. In the 1970s they began to collect water use data from all permit holders. Data collected before 1978 is on microfiche. After 1978 the water use data is on paper, and is not easily accessed, however it can be retrieved. Some computerization of the water use data records started in the late 70s, however due to the evolution of the changing computer systems, the record keeping was not stable until 1987. The first water use data considered reliable and accessible starts in 1988. The statewide record is generally about 93% complete, and moderately to fairly accurate, depending on the permit holder.

The city of Fargo has records of its use of water from the Red River that go back to 1946. The city of Moorhead has water use records that go back to 1952. Earlier Moorhead and Fargo water use data is taken from Byers et al (1946), Dennis et al (1949), and Wolf (1981). There are several amalgamations in the Moorhead water use data. The individual sources are listed and a combined total developed from the sum of those individual sources. A more accurate total is

listed in the "METERED TOTAL" column. This discrepancy is predominantly a result of the practice of bypassing the softening basin with the Moorhead East well water from 1952 until 1978. The well water that bypassed the softening basin wasn't metered. The remaining differences are the result of meter accuracy differences (1979-1995).

### Well Location Descriptors

In the effort to characterize the historic water levels and the water quality of the different aquifers in the study area, many old records, raw data sheets, and old reports were investigated. Particularly useful for old water levels were the USGS Water Supply Papers that reported water levels and artesian pressures from the 1930s to the 1970s. These reports (and other reports) listed locations that had well descriptors that would sometimes change through time, and sometimes would be called more than one thing at a time. At different times the well would be described with a reference number, or a reference name, or a geographical description. Tables 6A and 6B are the results of an effort to identify the different descriptors that have been used for data sites that have had varying names.

## **Community Water Supplies**

To identify the source of water supply for the many communities in the area, an effort was made to identify all known communities with a listing of their respective sources of water (Table 7). Table 7A lists the Minnesota communities, and table 7B lists the North Dakota communities.

**TABLE 5A. SOURCES OF WATER USE DATA TABULATED IN THE SUBSEQUENT TABLES.**

SOURCES OF DATA	WATER USER	WATER SOURCE	TIME PERIOD	DATA FREQUENCY	REMARKS
BYERS, et al (1946)	Fargo	Red River	1912-1941	annual	
	Fargo	Red River	1935-1941	monthly	
	Fargo	Fargo aquifer	1935-1941	monthly	
	Moorhead	ground water	1910-1934	annual	based on multiple year estimates
DENNIS, et al (1949)	Moorhead	ground water	1935-1941	monthly	
	Moorhead	Red River	1903-1909	annual	1906 estimated
	Moorhead	Red River & ground water	1910-1918	annual	big decrease in 1914 (power plant taking from river)
	Moorhead	ground water	1919-1947	annual	1946-47 estimated
	Fargo	Fargo aquifer	1938-1947	annual	no use in 1944-45
	West Fargo	West Fargo North aquifer	1937-1947	annual	
	Stockyards	West Fargo North aquifer	1936-1947	annual	
	Fairmont Creamery	ground water	1924-1947	annual	based on multiple year estimates
KLAUSING, part III (1968)	Moorhead Laundry	ground water	1906-1947	annual	based on multiple year estimates
	Union stockyard	West Fargo North aquifer	1965	annual	
	Siouxland Beef	West Fargo North aquifer	1965	annual	
	SW Fargo	West Fargo North aquifer	1965	annual	
	Village West Fargo	West Fargo North aquifer	1965	annual	
	Goldena Mills	West Fargo North aquifer	1965	annual	
KOTTA (personal comm.)	Comstock	ground water	1981-1993	annual	Arlen R. Kotta, City Councilman, Comstock
LOFGREN (personal comm.)	Glyndon	ground water	1986-1995	annual	Scott Lofgren, Maintenance Supervisor, Glyndon
MCLAIN (personal comm.)	Moorhead	Moorhead East aquifer	1952-1995	monthly	Cliff McLain, Public Service Dept., Moorhead
	Moorhead	Red River	1961-1995	monthly	
	Moorhead	Buffalo aquifer, south field	1968-1995	monthly	
	Moorhead	Buffalo aquifer, north field	1989-1995	monthly	
MN DNR water use records	Minn permitted water users	many	1978-1995	annual	data more reliable after 1988
NDSWC water use records	ND permitted water users	many	1965-1995	annual & monthly	
WELTON (personal comm.)	Fargo	Red River	1946-1965	annual	Bob Welton, Fargo City Engineer, Fargo
WOLF (1981)	Moorhead	Buffalo aquifer, south field	1948-1978	annual	from bar graph (figure 23)
