INTRODUCTION

The Spiritwood aquifer system underlies an area of approximately 110 square miles in southeastern LaMoure, northeastern Dickey and northwestern Sargent Counties (fig. 1). The Dickey-LaMoure County ground-water study provides data on the Spiritwood aquifer collected through 1976. The Ransom-Sargent County ground-water study provides data on the Spiritwood aquifer collected through 1977. Additional data has been collected from the Spiritwood aquifer in LaMoure, Dickey, and Sargent Counties since the completion of the county studies. The additional data provided the framework for a more detailed hydrogeologic investigation of the Spiritwood aquifer in this three county area. The results of this investigation are published in two parts. Part I is a compilation of the geologic and hydrologic data collected during this and previous investigations. Part II is an interpretive report which describes the hydrogeology of the Spiritwood aquifer in the study area.

FIGURE 1.—Study area location

PURPOSE AND OBJECTIVES

The purpose of this investigation is to establish a basis for the development of a management program for the Spiritwood aquifer in the study area. The objectives of this report are threefold: 1) to describe the present conceptual model of the aquifer system, 2) to determine which aspects of the conceptual model require further investigation, and 3) to propose a future work plan.

LOCATION-NUMBERING SYSTEM

The location-numbering system is based upon the location of a well or test hole in the Federal system of rectangular surveys of public lands (fig. 2). The first number denotes the township north of a baseline and the second number denotes the range west of the Fifth Principal Meridian. The third number indicates the section in which the well or test hole is located. The letters a, b, c, and d designate, respectively, the northeast, northwest, southwest, and southeast quarter section, quarter-quarter section, and quarter-quarter-quarter section (10 acre tract). Thus well 131-59-12AAA would be located in the NE^{1/4}NE^{1/4}NE^{1/4} Section 12, Township 131 North, Range 59 West. Consecutive terminal numerals are added if more than one well is located within a 10 acre tract.

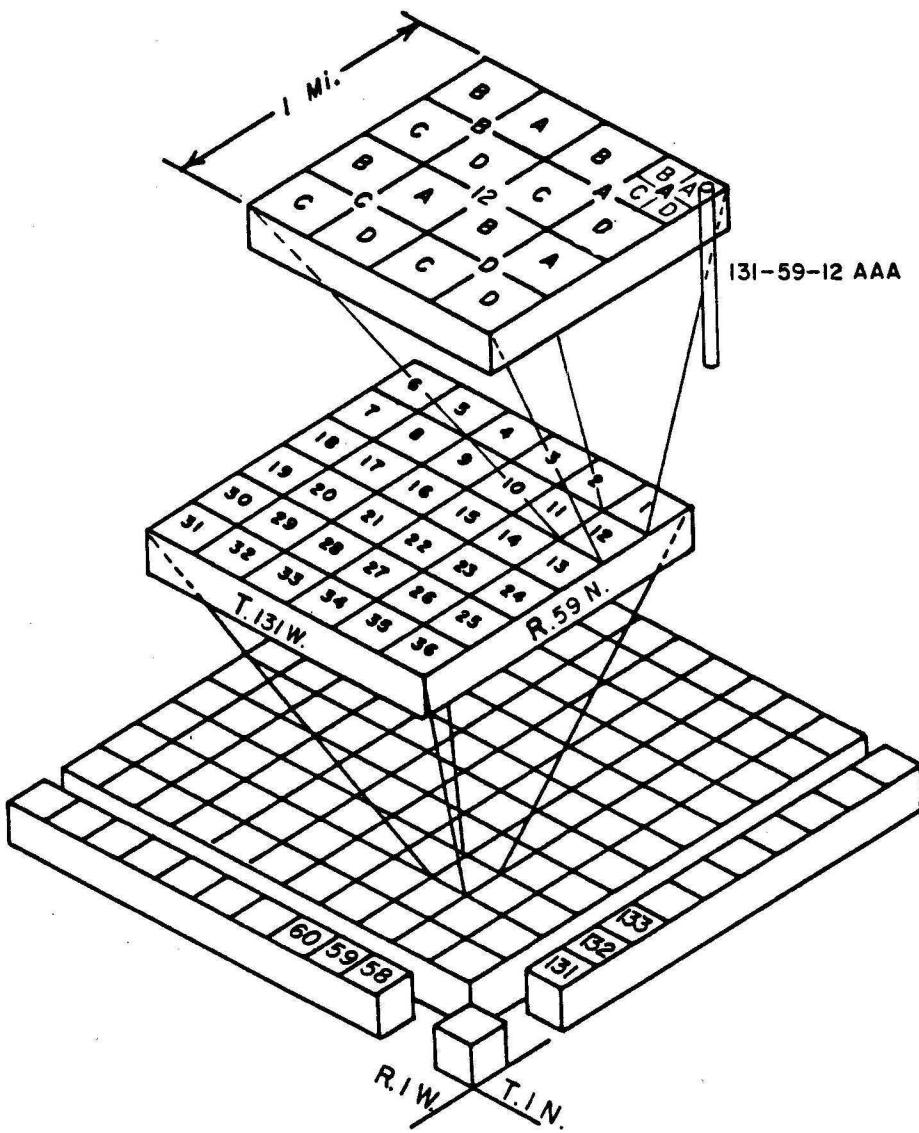

FIGURE 2.- Location-numbering system

ACKNOWLEDGEMENTS

The author is indebted to the residents of Dickey, LaMoure, and Sargent Counties who furnished essential information on wells and permitted the construction, measurement and sampling of the observation well network. Particular recognition is due to the following North Dakota State Water Commission personnel: Allen Comeskey, Paul Christensen and Steve Pusc for logging of test holes, Garvin Muri for chemical analysis of water samples and Milton Lindvig for scheduling the test drilling. Thanks are due to the various well drillers and drilling companies that furnished drillers' logs and other information in this report.

EXPLANATION OF DATA TABLES

For the most part, the data in this report was collected between 1973 and 1983. The points of collection are shown on Plate 1. The data consists of the following: 1) lithologic logs of 478 test holes and wells; 2) water level measurements in 147 observation wells; and 3) 172 chemical analyses of ground water.

Logs of Test Holes and Wells

The lithologic logs are from three sources. These include: 1) 310 lithologic logs from test holes completed under the direction of the North Dakota State Water Commission (Table 1A); 2) 15 lithologic logs from test holes completed under the direction of the U. S. Bureau of Reclamation (Table 1A); and 3) 153 logs from commercial well drillers (Table 1B). The lithologic logs in this report are summaries of the actual logs. Screened intervals of observation wells, domestic/stock wells, and irrigation wells are indicated at the bottom of each log. For many of the test holes, geophysical logs are available but are not included in this report. The grain size reported on the North Dakota State Water Commission lithologic logs is based on the Wentworth scale.

Land surface elevations are shown on each lithologic log. Land surface elevations indicated by integers were determined from $7\frac{1}{2}$ minute topographic quadrangles of the U. S. Geological Survey. Land surface elevations indicated by decimal numbers were determined by differential levelling techniques.

Water Levels in Selected Wells

Water levels from selected observation wells are shown in Table 2. The water levels are reported in feet below land surface and elevation

above mean sea level (NGVD, 1929). The aquifer in which the well is completed, the screened interval and land surface elevation (msl) are also indicated for each observation well. Water levels were measured using chalked steel tapes.

Chemical Analyses

Water samples were collected from most of the State Water Commission observation wells, domestic/stock wells and irrigation wells in the study area. 163 water samples were collected from wells completed in the Spiritwood aquifer. Nine water samples were collected from wells completed in glaciofluvial deposits which overlie the Spiritwood aquifer. The chemical analyses of these water samples are shown in Tables 3 and 4.

Elevation: 1438.1
(ft, msl)

Date Drilled: 7/7/80
Thickness Depth

Silt, sandy, sand, very fine to very coarse,
oxidized

4 4

Clay, silty, sandy, pebbly, pale yellow brown,
oxidized (till)

45 49

Clay, silty, sandy, pebbly, olive gray (till)

183 232

Sand and gravel, predominantly sand, very fine to
very coarse, predominantly medium, lots of
shield silicates, clay layers to 223, 226,
and 228 feet (Spiritwood aquifer)

232 253

Clay, dark black, non-calcareous (Pierre Formation)

7 260

Observation Well
S.I. = 248'- 251'

TABLE 4 — Chemical analyses: glacio fluvial deposits above the Spiritwood aquifer
 (Analytical results are in milligrams per liter except where indicated)

*Composite sample at pivot from two wells
